

# THE SNIFFEX DEVICE

*Telescoping antenna*

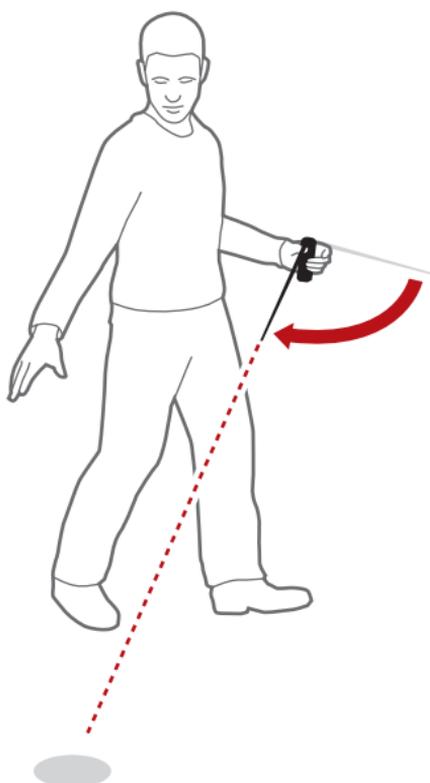

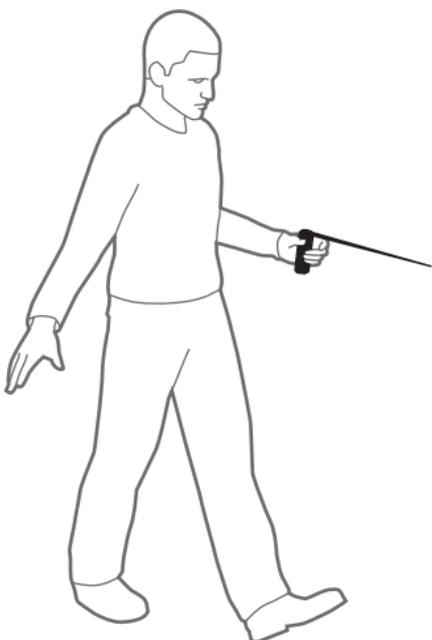

*Casing contains two pairs of magnets and a nitrous oxide detector called "Container 19"*

According to the sellers, Sniffex works by detecting the interference between the magnetic field of the earth, the explosive, the device and the human body. When it does, the antenna moves in the direction of the explosives.

**1** The operator holds the device at waist level as the opposite arm is extended.

**2** As the operator walks slowly around the test area, the antenna will rotate in the direction of the explosive.
