

Laws of Thermodynamics

0. Concept of Temperature - Equivalence Relation
1. Energy Conservation (can't win)  PPM 1
2. Entropy (can't break ~~even~~) PPM 2
3. Absolute zero temperature

Definitions

Thermodynamics - phenomenological description of equilibrium properties of macroscopic systems. (treat system like a black box.)
do not change with time (scale dependent)

Statistical Mechanics - probabilistic approach to equilibrium properties of a large number of degrees of freedom.

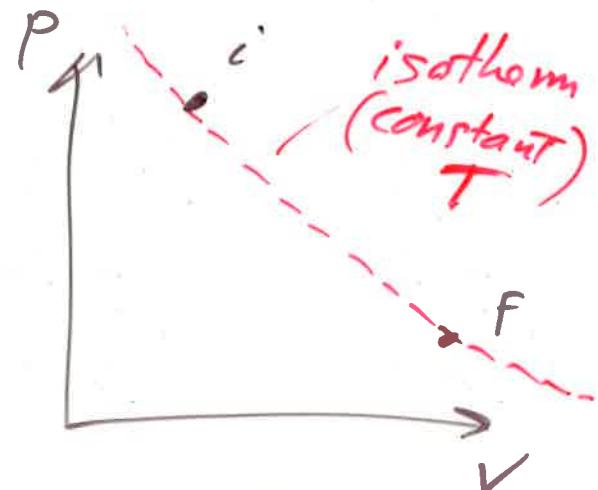

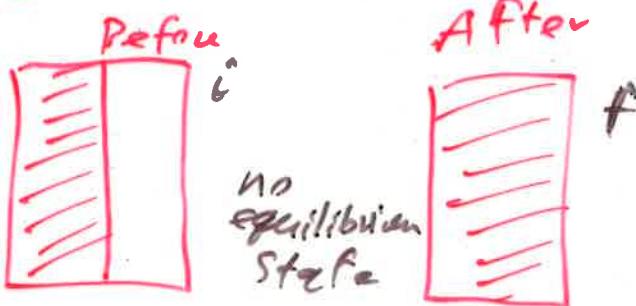

Heat - energy that flows spontaneously from hot to cold.

Adiabatic - (walls) do not allow heat to flow, insulating as opposite to diathermal.

- (processes) "slow" & "reversible"
System always near equilibrium, "frictionless"

Non-adiabatic example

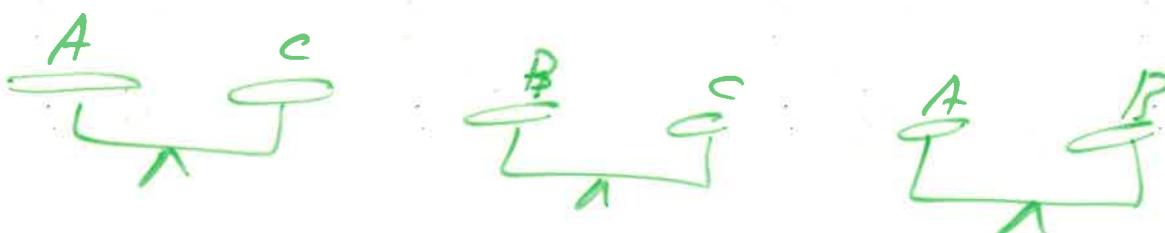

Joule-Kelvin expansion

Zeroth Law

If two systems ($A + B$) are each separately in thermal equilibrium with a third system (C), then $A + B$ are in thermal equilibrium with each other.

$$\begin{array}{l} T_A = T_C \\ T_B = T_C \end{array} \rightarrow T_A = T_B$$

$$\text{Weight}_A = \text{Weight}_B$$
