

Matching & Merging of Parton Showers and Matrix Elements

Frank Krauss

Institute for Particle Physics Phenomenology
Durham University

CTEQ school, Pittsburgh, 12./13.7.2013

Outline

- 1 Introduction: Why precision in event generators?
- 2 Parton-level calculations
- 3 Parton showers
- 4 NLO improvements: Matching
- 5 LO improvements: Multijet merging
- 6 NLO improvements: Multijet merging
- 7 Concluding remarks

introduction: why event generators?
and why is precision an issue?

Physics at the LHC & the need for event generators

- proton-proton collisions at the LHC:
 - processes with the highest energies ever at accelerator experiments
 - characteristically, signals and their backgrounds from hard interactions, with many particles in the final state
(due to strong interaction and huge phase space)
 - complex final states in many channels,
hard to gain detailed **quantitative** understanding from first principles/analytical work

need simulation \implies event generators

The dual role of event generators

- dichotomy in the application/use of event generators by experiments
- “experimental tool”:
 - unfolding of the detector,
 - determination of acceptance and corrections, ...
 - grasping corrections due to hadronisation, multiple interactions etc.
 - typically many parameters, allowing for more freedom
 - can be improved by improved parametrisations and tuning

(clearly, an understanding of physics helps in devising successful parametrisations!)

- “theory tool”:

(this is the kind of tool SHERPA strives to be)

- accurate description of signal and background,
- extrapolation from control to signal region,
- extraction of physics through comparison with data, ...
- typically few parameters, allowing for less freedom
- can be improved by improved accuracy of underlying calculations

(this yields improved/reduced errors)

The inner working of event generators ...

simulation: *divide et impera*

- **hard process:**
fixed order perturbation theory

traditionally: Born-approximation

- **bremstrahlung:**
resummed perturbation theory

- **hadronisation:**
phenomenological models

- **hadron decays:**
effective theories, data

- **"underlying event":**
phenomenological models

... and possible improvements

possible strategies:

- improving the phenomenological models:
 - “tuning” (fitting parameters to data)
 - replacing by better models, based on more physics
 - (my hot candidate: “minimum bias” and “underlying event” simulation)

- improving the perturbative description:
 - inclusion of higher order exact matrix elements and correct connection to resummation in the parton shower:
 - “NLO-Matching” & “Multijet-Merging”
 - systematic improvement of the parton shower:
 - next-to leading (or higher) logs & colours

Reminder: parton-level in perturbation theory

Cross sections at the LHC: Born approximation

$$d\sigma_{ab \rightarrow N} = \int_0^1 dx_a dx_b f_a(x_a, \mu_F) f_b(x_b, \mu_F) \int_{\text{cuts}} d\Phi_N \frac{1}{2\hat{s}} |\mathcal{M}_{p_a p_b \rightarrow N}(\Phi_N; \mu_F, \mu_R)|^2$$

- parton densities $f_a(x, \mu_F)$ (PDFs)
- phase space Φ_N for N -particle final states
- incoming current $1/(2\hat{s})$
- squared matrix element $\mathcal{M}_{p_a p_b \rightarrow N}$
(summed/averaged over polarisations)
- renormalisation and factorisation scales μ_R and μ_F
- complexity demands numerical methods for large N

Complexity: factorial growth in $e^+e^- \rightarrow q\bar{q} + ng$

n	#diags
0	1
1	2
2	8
3	48
4	384

Higher orders: some general thoughts

- obtained from adding diagrams with additional:
 loops (virtual corrections) or legs (real corrections)

- effect: reducing the dependence on μ_R & μ_F

(NLO first order allowing for meaningful estimate of uncertainties)

- additional difficulties when going NLO:
 ultraviolet divergences in virtual correction
 infrared divergences in real and virtual correction

enforce

UV regularisation & renormalisation
 IR regularisation & cancellation

(Kinoshita–Lee–Nauenberg–Theorem)

Structure of an NLO calculation

- sketch of cross section calculation

$$\begin{aligned}
 d\sigma_N^{(\text{NLO})} &= \underbrace{d\Phi_N \mathcal{B}_N}_{\substack{\text{Born} \\ \text{approximation}}} + \underbrace{d\Phi_N \mathcal{V}_N}_{\substack{\text{renormalised} \\ \text{virtual correction}}} + \underbrace{d\Phi_{N+1} \mathcal{R}_N}_{\substack{\text{real correction} \\ \text{IR-divergent}}} \\
 &= d\Phi_N \left[\mathcal{B}_N + \mathcal{V}_N + \mathcal{B}_N \otimes \mathcal{S} \right] + d\Phi_{N+1} \left[\mathcal{R}_N - \mathcal{B}_N \otimes d\mathcal{S} \right]
 \end{aligned}$$

- subtraction terms \mathcal{S} (integrated) and $d\mathcal{S}$:
exactly cancel IR divergence in \mathcal{R} – process-independent structures
- result: terms in both brackets **separately infrared finite**

Availability of exact calculations for hadron colliders

Parton showers

Probabilistic treatment of emissions

- Sudakov form factor (**no-decay** probability)

$$\Delta_{ij,k}^{(\mathcal{K})}(t, t_0) = \exp \left[- \int_{t_0}^t \frac{dt}{t} \frac{\alpha_S}{2\pi} \int dz \frac{d\phi}{2\pi} \underbrace{\mathcal{K}_{ij,k}(t, z, \phi)}_{\text{splitting kernel for } (ij) \rightarrow ij \text{ (spectator } k)} \right]$$

- evolution parameter t defined by kinematics

generalised angle (HERWIG++) or transverse momentum (PYTHIA, SHERPA)

- will replace $\frac{dt}{t} dz \frac{d\phi}{2\pi} \rightarrow d\Phi_1$
- scale choice for strong coupling: $\alpha_S(k_{\perp}^2)$

resums classes of higher logarithms

- regularisation through cut-off t_0

Emissions off a Born matrix element

- “compound” splitting kernels \mathcal{K}_n and Sudakov form factors $\Delta_n^{(\mathcal{K})}$ for emission off n -particle final state:

$$\mathcal{K}_n(\Phi_1) = \frac{\alpha_S}{2\pi} \sum_{\text{all } \{ij,k\}} \mathcal{K}_{ij,k}(\Phi_{ij,k}), \quad \Delta_n^{(\mathcal{K})}(t, t_0) = \exp \left[- \int_{t_0}^t d\Phi_1 \mathcal{K}_n(\Phi_1) \right]$$

- consider first emission only off Born configuration

$$d\sigma_B = d\Phi_N \mathcal{B}_N(\Phi_N)$$

$$\cdot \left\{ \Delta_N^{(\mathcal{K})}(\mu_N^2, t_0) + \int_{t_0}^{\mu_N^2} d\Phi_1 \left[\mathcal{K}_N(\Phi_1) \Delta_N^{(\mathcal{K})}(\mu_N^2, t(\Phi_1)) \right] \right\}$$

integrates to unity \rightarrow “unitarity” of parton shower

- further emissions by recursion with $Q^2 = t$ of previous emission

Aside: connection to resummation formalism

- consider standard Collins-Soper-Sterman formalism (CSS):

$$\frac{d\sigma_{AB\rightarrow X}}{dydQ_{\perp}^2} = d\Phi_X \mathcal{B}_{ij}(\Phi_X) \cdot \underbrace{\int \frac{d^2b_{\perp}}{(2\pi)^2} \exp(i\vec{b}_{\perp} \cdot \vec{Q}_{\perp}) \tilde{W}_{ij}(b; \Phi_X)}_{\substack{\text{guarantee 4-mom conservation} \\ \text{higher orders}}}$$

with

$$\tilde{W}_{ij}(b; \Phi_X) = \overbrace{C_i(b; \Phi_X, \alpha_S) C_j(b; \Phi_X, \alpha_S)}^{\text{collinear bits}} \overbrace{H_{ij}(\alpha_S)}^{\text{loops}} \exp \left[- \int_{1/b_{\perp}^2}^{Q_X^2} \frac{dk_{\perp}^2}{k_{\perp}^2} \left(A(\alpha_S(k_{\perp}^2)) \log \frac{Q_X^2}{k_{\perp}^2} + B(\alpha_S(k_{\perp}^2)) \right) \right]$$

Sudakov form factor, A, B expanded in powers of α_S

Connection to resummation formalism: log accuracy

- analyse structure of emissions above
- logarithmic accuracy in $\log \frac{\mu_N}{k_\perp}$ (a la CSS) possibly up to next-to leading log,
 - if evolution parameter \sim transverse momentum,
 - if argument in α_S is $\propto k_\perp$ of splitting,
 - if $K_{ij,k} \rightarrow$ terms $A_{1,2}$ and B_1 upon integration
(okay, if soft gluon correction is included, and if $K_{ij,k} \rightarrow$ AP splitting kernels)

- in CSS k_\perp typically is the transverse momentum of produced system, in parton shower of course related to the cumulative effect of explicit multiple emissions
- resummation scale $\mu_N \approx \mu_F$ given by (Born) kinematics – simple for cases like $q\bar{q}' \rightarrow V$, $gg \rightarrow H$, ... tricky for more complicated cases

A simple improvement: matrix element corrections

(M. Seymour, *Comp. Phys. Comm.* 90 (1995) 95 & E. Norrbin & T. Sjostrand, *Nucl. Phys.* B603 (2001) 297)

- parton shower ignores interferences typically present in matrix elements
- pictorially

$$\text{ME} : \left| \begin{array}{c} \text{diagram 1} \\ \text{diagram 2} \end{array} \right|^2 + \left| \begin{array}{c} \text{diagram 3} \\ \text{diagram 4} \end{array} \right|^2$$

$$\text{PS} : \left| \begin{array}{c} \text{diagram 1} \\ \text{diagram 2} \end{array} \right|^2 + \left| \begin{array}{c} \text{diagram 3} \\ \text{diagram 4} \end{array} \right|^2$$

The diagrams show two pairs of Feynman diagrams. Each pair consists of a tree-level diagram (green wavy line, blue straight lines) and a one-loop diagram (red wavy line). The ME calculation includes interference terms between the two diagrams in each pair, while the PS calculation does not.

- form many processes $\mathcal{R}_N < \mathcal{B}_N \times \mathcal{K}_N$
- typical processes: $q\bar{q}' \rightarrow V$, $e^-e^+ \rightarrow q\bar{q}$, $t \rightarrow bW$
- practical implementation: shower with usual algorithm, but reject first/hardest emissions with probability $\mathcal{P} = \mathcal{R}_N / (\mathcal{B}_N \times \mathcal{K}_N)$

- analyse **first** emission, given by

$$d\sigma_B = d\Phi_N \mathcal{B}_N(\Phi_N)$$

$$\cdot \left\{ \Delta_N^{(\mathcal{R}/\mathcal{B})}(\mu_N^2, t_0) + \int_{t_0}^{\mu_N^2} d\Phi_1 \left[\frac{\mathcal{R}_N(\Phi_N \times \Phi_1)}{\mathcal{B}_N(\Phi_N)} \Delta_N^{(\mathcal{R}/\mathcal{B})}(\mu_N^2, t(\Phi_1)) \right] \right\}$$

once more: integrates to unity \rightarrow “unitarity” of parton shower

- radiation given by \mathcal{R}_N (correct at $\mathcal{O}(\alpha_S)$)
(but modified by logs of higher order in α_S from $\Delta_N^{(\mathcal{R}/\mathcal{B})}$)
- emission phase space constrained by μ_N
- also known as “soft ME correction”
hard ME correction fills missing phase space
- used for “power shower”:
 $\mu_N \rightarrow E_{pp}$ and apply ME correction

NLO improvements: Matching

NLO matching: Basic idea

- parton shower resums logarithms
fair description of collinear/soft emissions
jet evolution (where the logs are large)
- matrix elements exact at given order
fair description of hard/large-angle emissions
jet production (where the logs are small)
- adjust (“match”) terms:
 - cross section at NLO accuracy & correct hardest emission in PS to exactly reproduce ME at order α_S (\mathcal{R} -part of the NLO calculation) (this is relatively trivial)
 - maintain (N)LL-accuracy of parton shower (this is not so simple to see)

The POWHEG-trick: modifying the Sudakov form factor

(P. Nason, JHEP 0411 (2004) 040 & S. Frixione, P. Nason & C. Oleari, JHEP 0711 (2007) 070)

- reminder: $\mathcal{K}_{ij,k}$ reproduces process-independent behaviour of $\mathcal{R}_N/\mathcal{B}_N$ in soft/collinear regions of phase space

$$d\Phi_1 \frac{\mathcal{R}_N(\Phi_{N+1})}{\mathcal{B}_N(\Phi_N)} \xrightarrow{\text{IR}} d\Phi_1 \frac{\alpha_S}{2\pi} \mathcal{K}_{ij,k}(\Phi_1)$$

- define **modified Sudakov form factor** (as in ME correction)

$$\Delta_N^{(\mathcal{R}/\mathcal{B})}(\mu_N^2, t_0) = \exp \left[- \int_{t_0}^{\mu_N^2} d\Phi_1 \frac{\mathcal{R}_N(\Phi_{N+1})}{\mathcal{B}_N(\Phi_N)} \right],$$

- assumes factorisation of phase space: $\Phi_{N+1} = \Phi_N \otimes \Phi_1$
- typically will adjust scale of α_S to parton shower scale

Local K -factors

(P. Nason, JHEP 0411 (2004) 040 & S. Frixione, P. Nason & C. Oleari, JHEP 0711 (2007) 070)

- start from Born configuration Φ_N with NLO weight:

("local K -factor")

$$\begin{aligned}
 d\sigma_N^{(\text{NLO})} &= d\Phi_N \bar{\mathcal{B}}(\Phi_N) \\
 &= d\Phi_N \left\{ \mathcal{B}_N(\Phi_N) + \underbrace{\mathcal{V}_N(\Phi_N) + \mathcal{B}_N(\Phi_N) \otimes \mathcal{S}}_{\check{\mathcal{V}}_N(\Phi_N)} \right. \\
 &\quad \left. + \int d\Phi_1 [\mathcal{R}_N(\Phi_N \otimes \Phi_1) - \mathcal{B}_N(\Phi_N) \otimes d\mathcal{S}(\Phi_1)] \right\}
 \end{aligned}$$

- by construction: exactly reproduce cross section at NLO accuracy
- note: second term vanishes if $\mathcal{R}_N \equiv \mathcal{B}_N \otimes d\mathcal{S}$

(relevant for MC@NLO)

NLO accuracy in radiation pattern

(P. Nason, JHEP 0411 (2004) 040 & S. Frixione, P. Nason & C. Oleari, JHEP 0711 (2007) 070)

- generate emissions with $\Delta_N^{(\mathcal{R}/\mathcal{B})}(\mu_N^2, t_0)$:

$$d\sigma_N^{(\text{NLO})} = d\Phi_N \bar{\mathcal{B}}(\Phi_N) \times \underbrace{\left\{ \Delta_N^{(\mathcal{R}/\mathcal{B})}(\mu_N^2, t_0) + \int_{t_0}^{\mu_N^2} d\Phi_1 \frac{\mathcal{R}_N(\Phi_N \otimes \Phi_1)}{\mathcal{B}_N(\Phi_N)} \Delta_N^{(\mathcal{R}/\mathcal{B})}(\mu_N^2, k_\perp^2(\Phi_1)) \right\}}_{\text{integrating to yield 1 - "unitarity of parton shower"}}$$

- radiation pattern like in ME correction
- pitfall, again: choice of upper scale μ_N^2 (this is vanilla POWHEG!)
- apart from logs: which configurations enhanced by local K -factor

(K -factor for inclusive production of X adequate for X + jet at large p_\perp ?)

POWHEG features

S. Alioli, P. Nason, C. Oleari, & E. Re, JHEP 0904 (2009) 002

- large enhancement at high $p_{T,h}$
- can be traced back to large NLO correction
- fortunately, NNLO correction is also large $\rightarrow \sim$ agreement

Improved POWHEG

S. Alioli, P. Nason, C. Oleari, & E. Re, JHEP 0904 (2009) 002

- split real-emission ME as

$$\mathcal{R} = \mathcal{R} \left(\underbrace{\frac{h^2}{p_{\perp}^2 + h^2}}_{\mathcal{R}^{(S)}} + \underbrace{\frac{p_{\perp}^2}{p_{\perp}^2 + h^2}}_{\mathcal{R}^{(F)}} \right)$$

- can “tune” h to mimick NNLO - or maybe resummation result
- differential event rate up to first emission

$$d\sigma = d\Phi_B \bar{\mathcal{B}}^{(R^{(S)})} \left[\Delta^{(R^{(S)}/B)}(s, t_0) + \int_{t_0}^s d\Phi_1 \frac{\mathcal{R}^{(S)}}{B} \Delta^{(R^{(S)}/B)}(s, k_{\perp}^2) \right] + d\Phi_R \mathcal{R}^{(F)}(\Phi_R)$$

Resummation in MC@NLO

- divide \mathcal{R}_N in soft (“S”) and hard (“H”) part:

$$\mathcal{R}_N = \mathcal{R}_N^{(S)} + \mathcal{R}_N^{(H)} = \mathcal{B}_N \otimes d\mathcal{S}_1 + \mathcal{H}_N$$

- identify subtraction terms and shower kernels $d\mathcal{S}_1 \equiv \sum_{\{ij,k\}} \mathcal{K}_{ij,k}$

(modify \mathcal{K} in 1st emission to account for colour)

$$d\sigma_N = d\Phi_N \underbrace{\tilde{\mathcal{B}}_N(\Phi_N)}_{\mathcal{B}+\tilde{\mathcal{V}}} \left[\Delta_N^{(\mathcal{K})}(\mu_N^2, t_0) + \int_{t_0}^{\mu_N^2} d\Phi_1 \mathcal{K}_{ij,k}(\Phi_1) \Delta_N^{(\mathcal{K})}(\mu_N^2, k_\perp^2) \right] \\ + d\Phi_{N+1} \mathcal{H}_N$$

- effect: only resummed parts modified with local K -factor

Aside: phase space/ K -factor effects

(S. Alioli, P. Nason, C. Oleari, & E. Re, JHEP 0904 (2009) 002 &

S. Hoeche, F. Krauss, M. Schoenherr, & F. Siegert, JHEP 1209 (2012) 049)

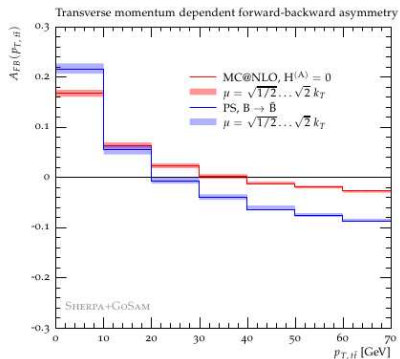

- problem: impact of subtraction terms on local K -factor (filling of phase space by parton shower)
- studied in case of $gg \rightarrow H$ above
- proper filling of available phase space by parton shower paramount

Aside': impact of full colour

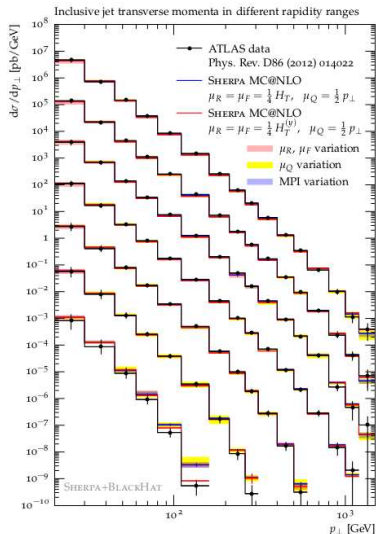

(S. Hoeche, J. Huang, G. Luisoni, M. Schoenherr, & J. Winter, arXiv:1306.2703 [hep-ph])

- evaluate effect of full colour treatment, MC@NLO without \mathbf{H} -part vs. parton shower with $\mathcal{B} \rightarrow \tilde{\mathcal{B}}$
- take $t\bar{t}$ production

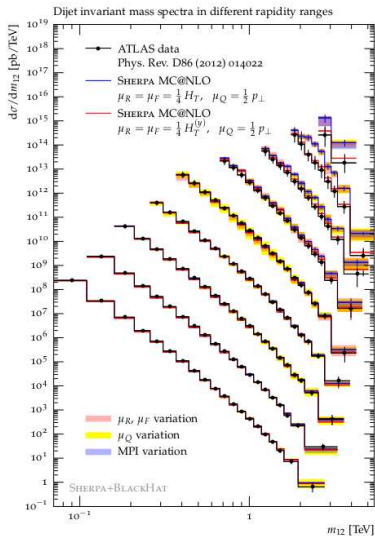

MC@NLO for light jets: $jet-p_{\perp}$

(S. Hoeche & M. Schoenherr, Phys. Rev. D86 (2012) 094042)

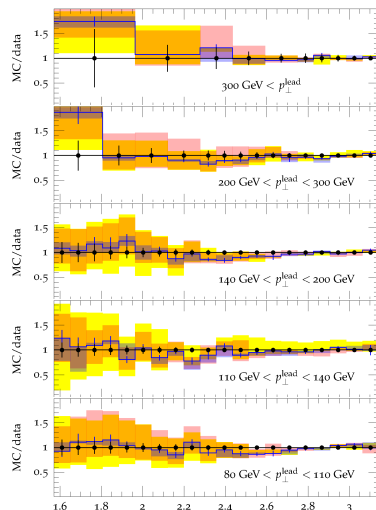

MC@NLO for light jets: dijet mass

(S. Hoeche & M. Schoenherr, Phys. Rev. D86 (2012) 094042)

MC@NLO for light jets: azimuthal decorrelations

(S. Hoeche & M. Schoenherr, Phys. Rev. D86 (2012) 094042)

MC@NLO for light jets: R_{32} & forward energy flow

(S. Hoeche & M. Schoenherr, Phys. Rev. D86 (2012) 094042)

MC@NLO for light jets: jet vetoes

(S. Hoeche & M. Schoenherr, Phys. Rev. D86 (2012) 094042)

Summary of 1st lecture

Summary of 1st lecture

- reviewed higher order calculations and parton shower, with emphasis on accuracy
- these things are not blackboxes and can be understood
- systematic improvement of event generators by including higher orders has been at the core of QCD theory and developments in the past decade:
 - **ME corrections**
 - **NLO matching** (“MC@NLO”, “POWHEG”)

Multijet merging @ leading order

Multijet merging: basic idea

(S. Catani, F. Krauss, R. Kuhn, B. Webber, JHEP 0111 (2001) 063,

L. Lonnblad, JHEP 0205 (2002) 046, & F. Krauss, JHEP 0208 (2002) 015)

- parton shower resums logarithms
fair description of collinear/soft emissions
jet evolution (where the logs are large)
- matrix elements exact at given order
fair description of hard/large-angle emissions
jet production (where the logs are small)
- combine (“merge”) both:
result: “towers” of MEs with increasing number of jets evolved with PS
 - multijet cross sections at Born accuracy
 - maintain (N)LL accuracy of parton shower

Separating jet evolution and jet production

- separate regions of jet production and jet evolution with jet measure Q_J

(“truncated showering” if not identical with evolution parameter)

- matrix elements populate hard regime
- parton showers populate soft domain

Why it works: jet rates with the parton shower

- consider jet production in $e^+e^- \rightarrow \text{hadrons}$
Durham jet definition: relative transverse momentum $k_\perp > Q_J$
- fixed order: one factor α_S and up to $\log^2 \frac{E_{\text{c.m.}}}{Q_J}$ per jet
- use **Sudakov form factor** for resummation & replace **approximate fixed order** by exact expression:

$$\mathcal{R}_2(Q_J) = [\Delta_q(E_{\text{c.m.}}^2, Q_J^2)]^2$$

$$\mathcal{R}_3(Q_J) = 2\Delta_q(E_{\text{c.m.}}^2, Q_J^2) \int_{Q_J^2}^{E_{\text{c.m.}}^2} \frac{dk_\perp^2}{k_\perp^2} \left[\frac{\alpha_S(k_\perp^2)}{2\pi} dz \mathcal{K}_q(k_\perp^2, z) \right. \\ \left. \times \Delta_q(E_{\text{c.m.}}^2, k_\perp^2) \Delta_q(k_\perp^2, Q_J^2) \Delta_g(k_\perp^2, Q_J^2) \right]$$

First emission(s), again

(S. Hoeche, F. Krauss, S. Schumann, F. Siegert, JHEP 0905 (2009) 053)

$$d\sigma = d\Phi_N \mathcal{B}_N \left[\Delta_N^{(\mathcal{K})}(\mu_N^2, t_0) + \int_{t_0}^{\mu_N^2} d\Phi_1 \mathcal{K}_N \Delta_N^{(\mathcal{K})}(\mu_N^2, t_{N+1}) \Theta(Q_J - Q_{N+1}) \right] \\ + d\Phi_{N+1} \mathcal{B}_{N+1} \Delta_N^{(\mathcal{K})}(\mu_{N+1}^2, t_{N+1}) \Theta(Q_{N+1} - Q_J)$$

- note: $N + 1$ -contribution includes also $N + 2$, $N + 3$, ...

(no Sudakov suppression below t_{n+1} , see further slides for iterated expression)

- potential occurrence of different shower start scales: $\mu_{N,N+1}, \dots$
- “unitarity violation” in square bracket: $\mathcal{B}_N \mathcal{K}_N \longrightarrow \mathcal{B}_{N+1}$

(cured with UMEPs formalism, L. Lonnblad & S. Prestel, JHEP 1302 (2013) 094 &

S. Platzer, arXiv:1211.5467 [hep-ph] & arXiv:1307.0774 [hep-ph])

Iterating the emissions

(S. Hoeche, F. Krauss, S. Schumann, F. Siegert, JHEP 0905 (2009) 053)

$$\begin{aligned}
 d\sigma = & \sum_{n=N}^{n_{\max}-1} \left\{ d\Phi_n \mathcal{B}_n \overbrace{\left[\prod_{j=N}^{n-1} \Theta(Q_{j+1} - Q_j) \right]}^{(n-N) \text{ extra jets}} \overbrace{\left[\prod_{j=N}^{n-1} \Delta_j^{(\mathcal{K})}(t_j, t_{j+1}) \right]}^{\text{no emissions off internal lines}} \right. \\
 & \times \left[\underbrace{\Delta_n^{(\mathcal{K})}(t_n, t_0)}_{\text{no emission}} + \underbrace{\int_{t_0}^{t_n} d\Phi_1 \mathcal{K}_n \Delta_n^{(\mathcal{K})}(t_n, t_{n+1}) \Theta(Q_j - Q_{n+1})}_{\text{next emission no jet \& below last ME emission}} \right] \\
 & + d\Phi_{n_{\max}} \mathcal{B}_{n_{\max}} \left[\prod_{j=N}^{n_{\max}-1} \Theta(Q_{j+1} - Q_j) \right] \left[\prod_{j=N}^{n_{\max}-1} \Delta_j^{(\mathcal{K})}(t_j, t_{j+1}) \right] \\
 & \times \left[\Delta_{n_{\max}}^{(\mathcal{K})}(t_{n_{\max}}, t_0) + \int_{t_0}^{t_{n_{\max}}} d\Phi_1 \mathcal{K}_{n_{\max}} \Delta_{n_{\max}}^{(\mathcal{K})}(t_{n_{\max}}, t_{n_{\max}+1}) \right]
 \end{aligned}$$

ME & PS results: inclusive jets in DIS

Multijet merging @ next-to leading order

Multijet-merging at NLO: MEPs@NLO

- basic idea like at LO: towers of MEs with increasing jet multi (but this time at NLO)
- combine them into one sample, remove overlap/double-counting

maintain NLO and (N)LL accuracy of ME and PS

- this effectively translates into a merging of MC@NLO simulations and can be further supplemented with LO simulations for even higher final state multiplicities

First emission(s), once more

$$\begin{aligned}
 d\sigma = & d\Phi_N \tilde{\mathcal{B}}_N \left[\Delta_N^{(\mathcal{K})}(\mu_N^2, t_0) + \int_{t_0}^{\mu_N^2} d\Phi_1 \mathcal{K}_N \Delta_N^{(\mathcal{K})}(\mu_N^2, t_{N+1}) \Theta(Q_J - Q_{N+1}) \right] \\
 & + d\Phi_{N+1} \mathcal{H}_N \Delta_N^{(\mathcal{K})}(\mu_N^2, t_{N+1}) \Theta(Q_J - Q_{N+1}) \\
 & + d\Phi_{N+1} \tilde{\mathcal{B}}_{N+1} \left(1 + \frac{\mathcal{B}_{N+1}}{\tilde{\mathcal{B}}_{N+1}} \int_{t_{N+1}}^{\mu_N^2} d\Phi_1 \mathcal{K}_N \right) \Theta(Q_{N+1} - Q_J) \\
 & \cdot \left[\Delta_{N+1}^{(\mathcal{K})}(t_{N+1}, t_0) + \int_{t_0}^{t_{N+1}} d\Phi_1 \mathcal{K}_{N+1} \Delta_{N+1}^{(\mathcal{K})}(t_{N+1}, t_{N+2}) \right] \\
 & + d\Phi_{N+2} \mathcal{H}_{N+1} \Delta_N^{(\mathcal{K})}(\mu_N^2, t_{N+1}) \Delta_{N+1}^{(\mathcal{K})}(t_{N+1}, t_{N+2}) \Theta(Q_{N+1} - Q_J) + \dots
 \end{aligned}$$

MEPS@NLO: example results for $e^-e^+ \rightarrow \text{hadrons}$

MEPs@NLO: example results for $e^-e^+ \rightarrow \text{hadrons}$

Example: MEPs@NLO for W +jets

(up to two jets @ NLO, from BlackHat, see arXiv: 1207.5031 [hep-ex])

Example: MEPS@NLO for W^+W^-+jets

(in prep., up to one jet @ NLO, virtuals from OPENLOOPS, all interferences, no Higgs)

Summary

Summary

- systematic improvement of event generators by including higher orders has been at the core of QCD theory and developments in the past decade:
 - **multijet merging** (“CKKW”, “MLM”)
 - **NLO matching** (“MC@NLO”, “POWHEG”)
 - **MENLOPS** – combination of matching and merging
 - **multijet merging at NLO** (MEPs@NLO, “FxFx”)

(first 3 methods well understood and used in experiments)

- multijet merging at NLO under scrutiny
- complete automation of NLO calculations \approx done time to optimise the impact of this gargantuan task

“So what's this? I asked for a hammer!
A hammer! This is a crescent wrench! ...
Well, maybe it's a hammer. ... Damn these loose
tools.”
