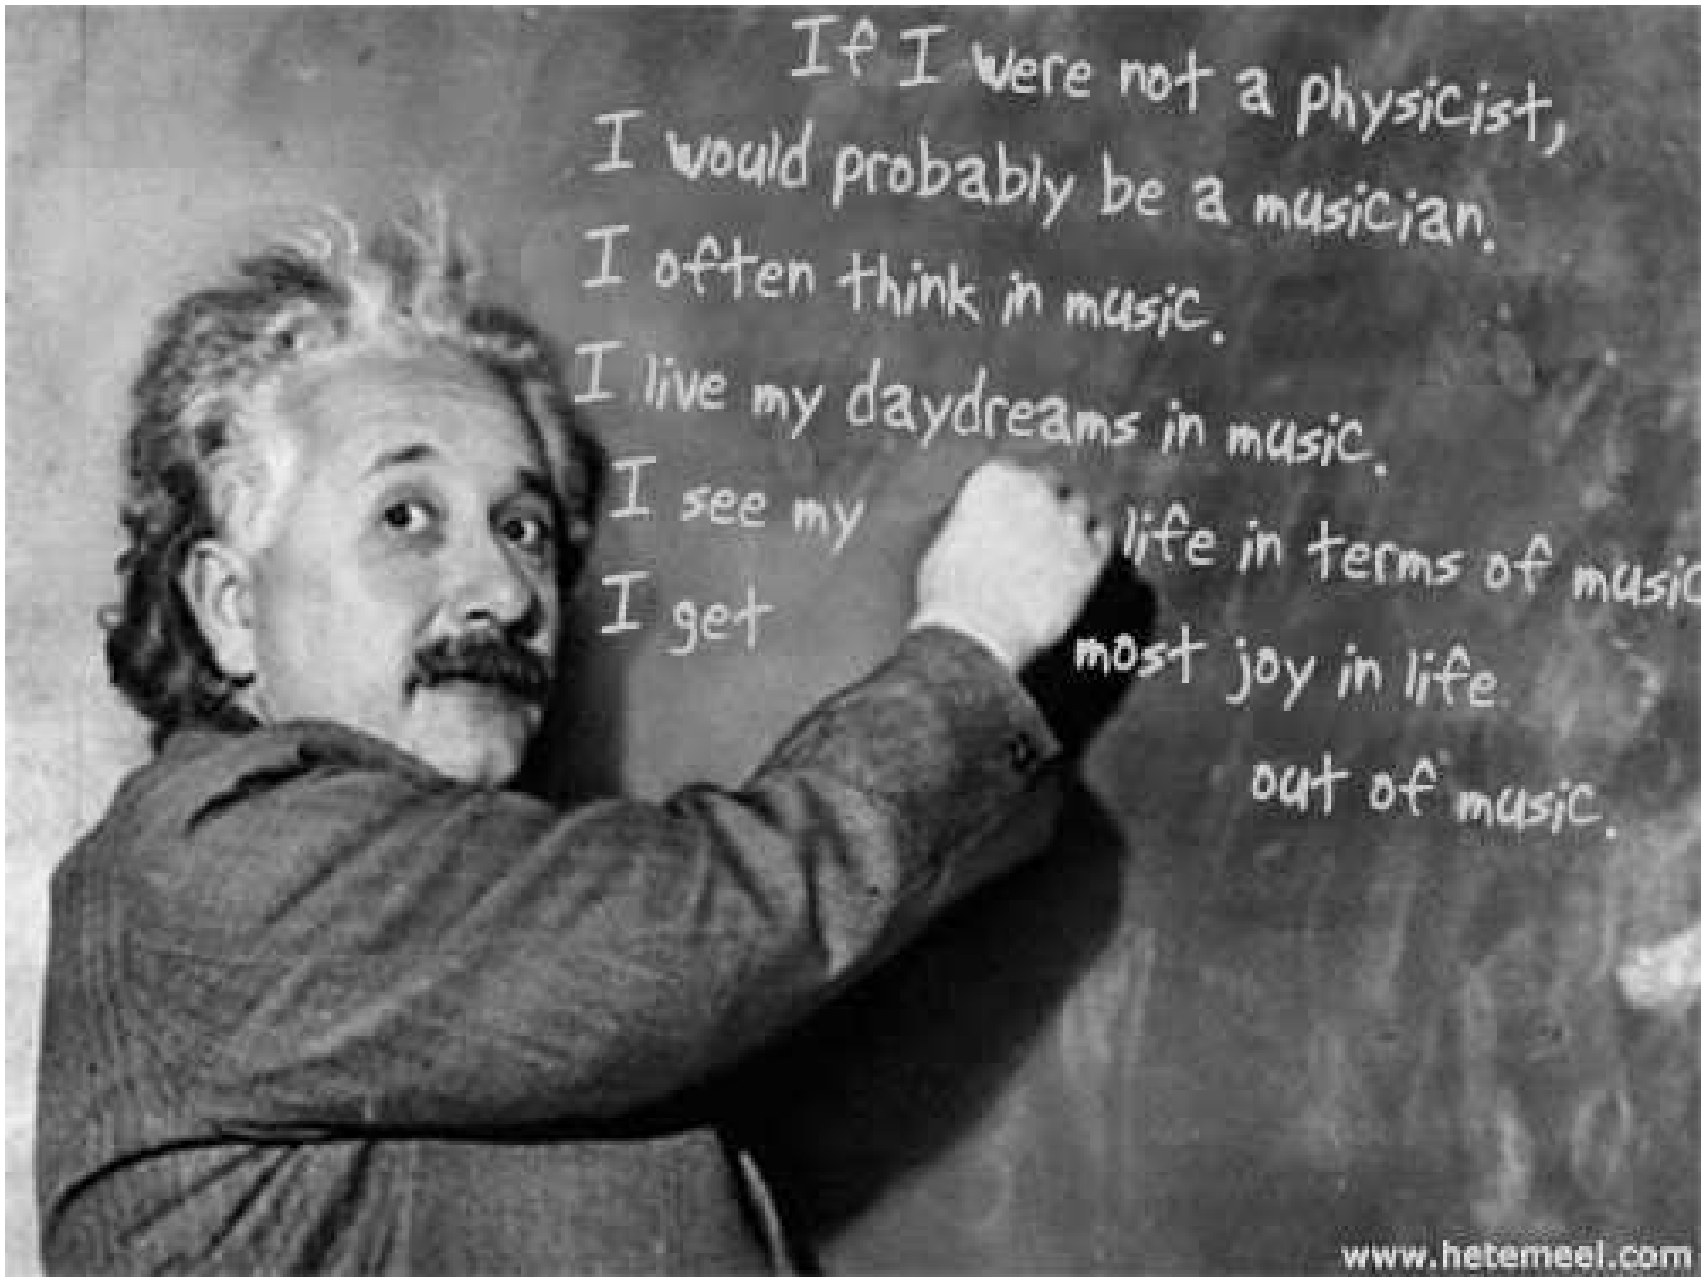
Symmetries of Physis and Music
by Fred Olness
SMU
www.hetemeel.com



If I were not a physicist,
I would probably be a musician.
I often think in music.
I live my daydreams in music.
I see my life in terms of music
I get most joy in life
out of music.
www.hetemeel.com

“If I were not a physicist, I would probably be a musician. I often think in music. I live my daydreams in music. I see my life in terms of music. ... I get most joy in life out of music.”

When Albert Einstein was asked if his interest in music helped with the development of the theory of relativity, he responded: “It occurred to me by intuition, and music was the driving force behind that intuition. My discovery was the result of musical perception.”

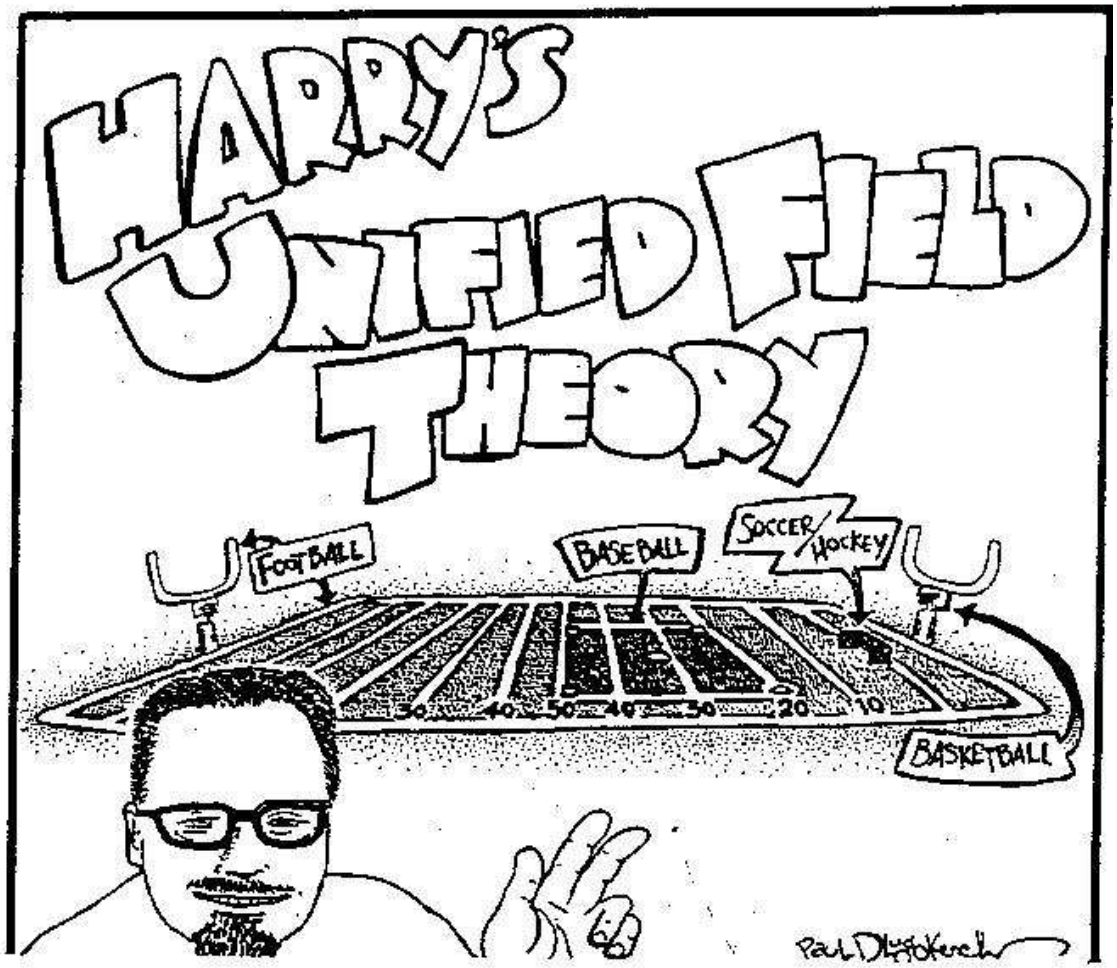
Complex
Difficult to remember
Hard to fit on a T-Shirt

There are a variety of Grand Unified Theories



Others predict the existence of:*

SUSY
Higgs Bosons
SuperStrings
...

How will we find these???

We need higher energies to access these proposed particles

Compare these machines:

LEP	e^+e^-	$\sqrt{s} = 200$ GeV
HERA	ep	$\sqrt{s} = 314$ GeV
RHIC	NN	$\sqrt{s} = N \times 100$ GeV
Tevatron	p - p-bar	$\sqrt{s} = 2000$ GeV
LHC	pp	$\sqrt{s} = 14{,}000$ GeV

Hadron beams provide the highest energy

The world: Pre-Columbus

LHC: The High Energy Frontier (2007)

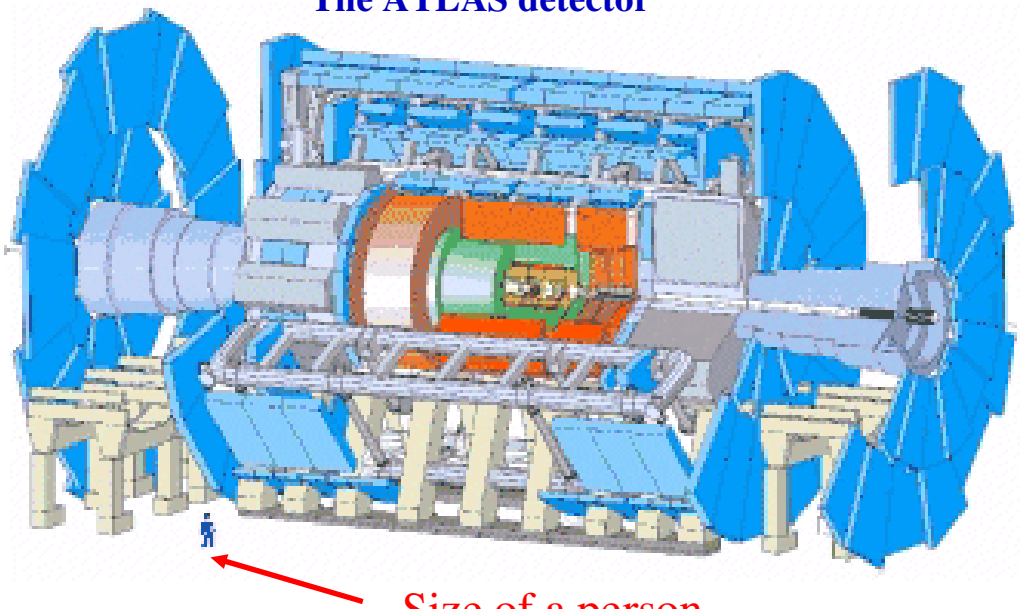
P P collisions

$\sqrt{s}$ = 14,000 GeV

Note: 5 GeV ~ 1 Fermi

$\therefore$ 14,000 GeV ~ 3×10^{-19}m

The ATLAS detector



Size of a person

The LHC is poised to open up one of the largest kinematic frontiers in many decades

You need big detectors to study small stuff!!!

An Example: The Higgs Boson

Scientists glimpse elusive particle

Los Angeles Times

GENEVA — For more than 20 years, scientists around the world have been searching for an invisible particle that determines the basic properties of matter. The particle, called a "Higgs boson," is thought to be a vibrating chunk of the unseen vacuum that underlies everything in the universe.

Friday, physicists at the European laboratory CERN are set to announce what they believe is the first glimpse of the Higgs boson.

The evidence is by no means conclusive. But the discovery of the Higgs boson is considered critical to physics — not only concluding one chapter but also opening the door to another undiscovered realm.

Once physicists understand this pervasive, unseen influence, they will be able to answer a question so fundamental that ancient thinkers probably never even dared to ask it: "Why does matter have mass?"

Collider experiments reveal 'Higgs boson'

Said Chris Tully of Princeton: "I think it will eventually be hailed as one of the greatest achievements you can make in science."

Possible traces of the particle were detected in experiments in the 17-mile-around Large Electron Positron collider, or LEP, by crashing atomic particles at high speeds.

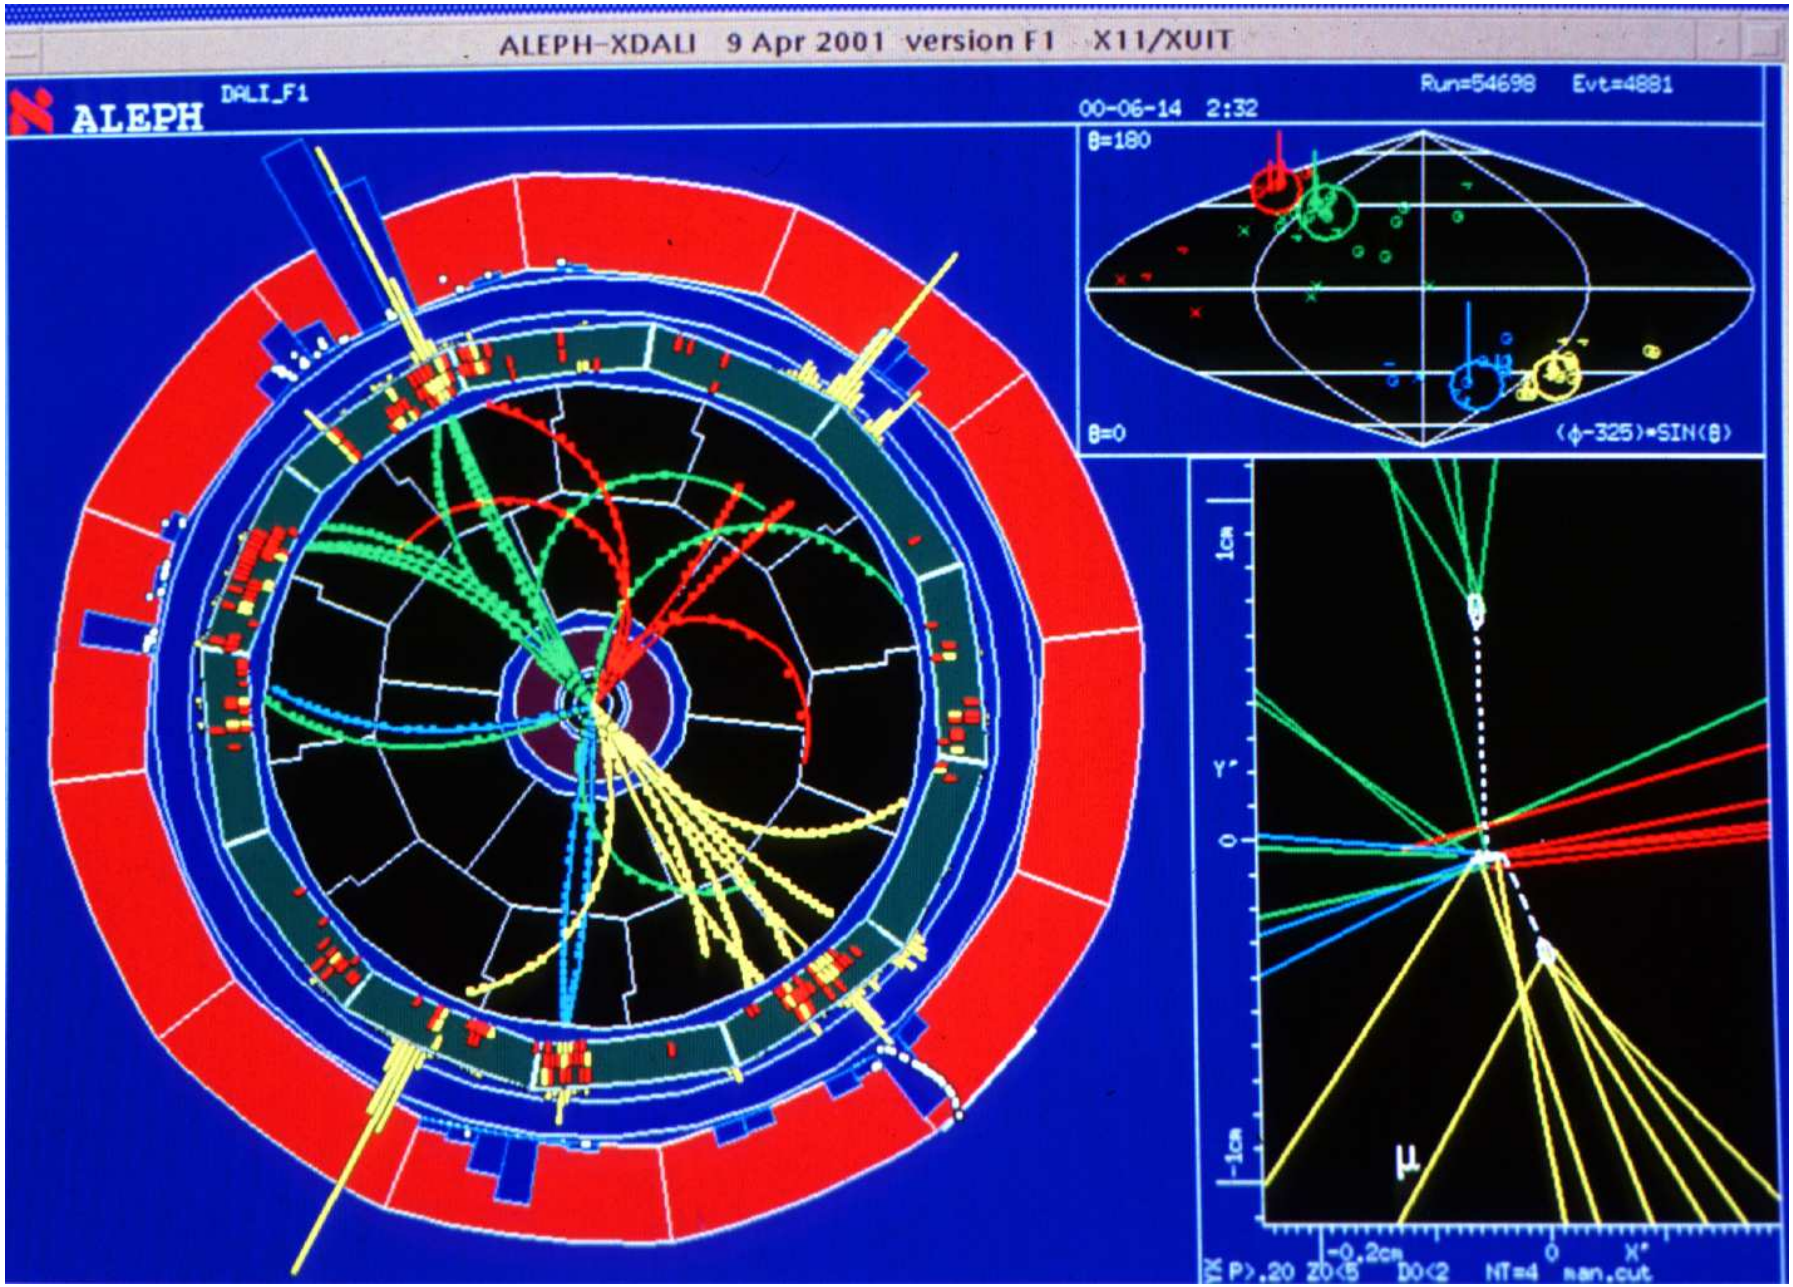
Tracks suggesting the possible presence of the so-far unseen particle have teased CERN physicists with a frustrating succession of appearances and disappearances over the past month. But evidence accumulated last week convinced them to request an emergency resuscitation of the aging accelerator. CERN officials had previously decided to tear down the collider.

Skeptics have been saying for weeks that the hints that surfaced at CERN last month were only wishful thinking.

But in a dizzying series of events, two detectors at the collider spied what scientists feel are solid Higgs tracks.

"Among physicists, we believe we have them. But we don't believe we have enough of them" to claim a discovery, said Jason Nielsen, a graduate student from the University of Wisconsin.

Is this a Higgs Boson??? $e^+e^- \rightarrow Z \rightarrow ZH \rightarrow$ bbjj



How do we know what to look for???

Symmetries: A brief history

Einstein's Special Relativity: 1905

- All inertial reference frames are created equal
- Light travels with speed *c* in all frames

Gauge Symmetry (and Gauge Invariance) 1954

- Physics is independent of gauge (~ coordinate system)
- Higgs Boson respects gauge invariance

SUSY: SuperSymmetry 1976 *(6453 Theory Papers; 0 Data)*

- There exists a symmetry between Fermions and Bosons
- Previously:
  - Fermions (s=1/2: building blocks)
  - Bosons (s=0,1, ... : forces)

Mathematical String Theology: 1974 *(4870 Theory Papers; 0 Data)*

Things are simple in 11 dimensions

Symmetries play a central role in physics

... and in music

Symmetries in music:

Johann Sebastian Bach 1685-1750

... height of Baroque

Fugue: A type of Baroque composition similar to a crossword puzzle, but with fewer clues. The greatest fugue composer was J.S. Bach, who died before completing his seminal work, The Art of Fugue. Many musicians since have died trying to play it. *(One misguided musicologist who thought that the Fugue was actually an 18th century portrait painter was unceremoniously drummed out of the profession, and has since made a fortune writing record-liner notes.)* Stolen from: *A Musician's Dictionary*, by David W. Barber

Counterpoint: A musical device similar to needlepoint, although not designed to be hung on the wall or used on seat covers. Said to be a musical conversation, it more often resembles an argument. A favorite device of many Baroque composers, all of whom are now dead---although a direct connection between these two has never been conclusively established. Although no longer in practice by modern composers, it's still taught in schools, as a form of punishment.

Stolen from: *A Musician's Dictionary*, by David W. Barber

GENERAL RULES FOR COUNTERPOINT

(Numbers in brackets refer to Rules as listed in the Palestrina computer program.)

The Cantus Firmus (which means fixed or pre-existing voice or part, and is usually abbreviated as CF) will be provided by me.

Your counterpoint:

conjunct movement wherever possible (2, 6, 13)

permitted leaps are the octave, perfect 4th, perfect 5th, major and minor 3rds, minor 6th (ascending only). You cannot use augmented or diminished leaps, 7ths of any kind, leaps greater than an octave (1)

avoid outlining augmented or diminished leaps (i.e. having them within about 3 or 4 notes of each other (see below, under 'leaps'). Therefore two consecutive leaps in the same direction are forbidden (12)

a leap is usually followed by a step back within the leap; occasionally by a step in the same direction (i.e. a little further). If you wish a leap to be followed by a leap back within the interval (which is certainly permissible) you will have to be careful that the notes follow the harmonic rules (see below) (10)

Your harmony:

until allowed to do otherwise, you must make all intervals concordant. Concords are of two types:

perfect concords: octaves and fifths;

imperfect concords: major and minor 3rd, major and minor 6th (15)

Two consecutive perfect concords are forbidden (22, 23, 24). This covers not only consecutive 5ths and 8ves, but a 5th moving to an octave. The only exception to this is a 5th moving down to an 8ve, especially at a cadence.

Discords are forbidden. These are 2nds, 7ths, diminished and augmented intervals, and, most important, perfect 4ths (15)

Moving in parallel upwards to a perfect concord is also forbidden, even from an imperfect concord (21)

In two parts spacing should not exceed a 12th (an octave and a fifth) (28)

Exercises should start on a unison or fifth (or their octaves) and finish on a unison or octave (19)

Actual unisons (i.e. the same note) may appear only at the beginning and end (18)

The harmony should be written in such a way that the melodic lines are so smooth that they are easily singable (14)

Check for careless errors, such as additional beats or half-beats (20)

Note: these are not my rules; they come from observing what happens in real music. If in doubt, look at the music yourself; the works of Palestrina make a good starting-point.

Clefs:

We shall sometimes use C-clefs. The C indicated by a C-clef is always middle C. For nomenclature count up from the bottom line (e.g. the tenor C-clef is C4). More often we shall use the transposed G-clef for the tenor, the subscript 8 indicating down an octave.

Wagner's music is
better than it sounds.

Mark Twain

What makes Good vs. Bad music???

Where do the rules of Counterpoint come from???

Is there a symmetry underlying the music???

Harmony: Over-simplified

$$f_{beats} = \Delta f$$
