

THE HUMAN EYE

Prof. Stephen Sekula

4/28/2011

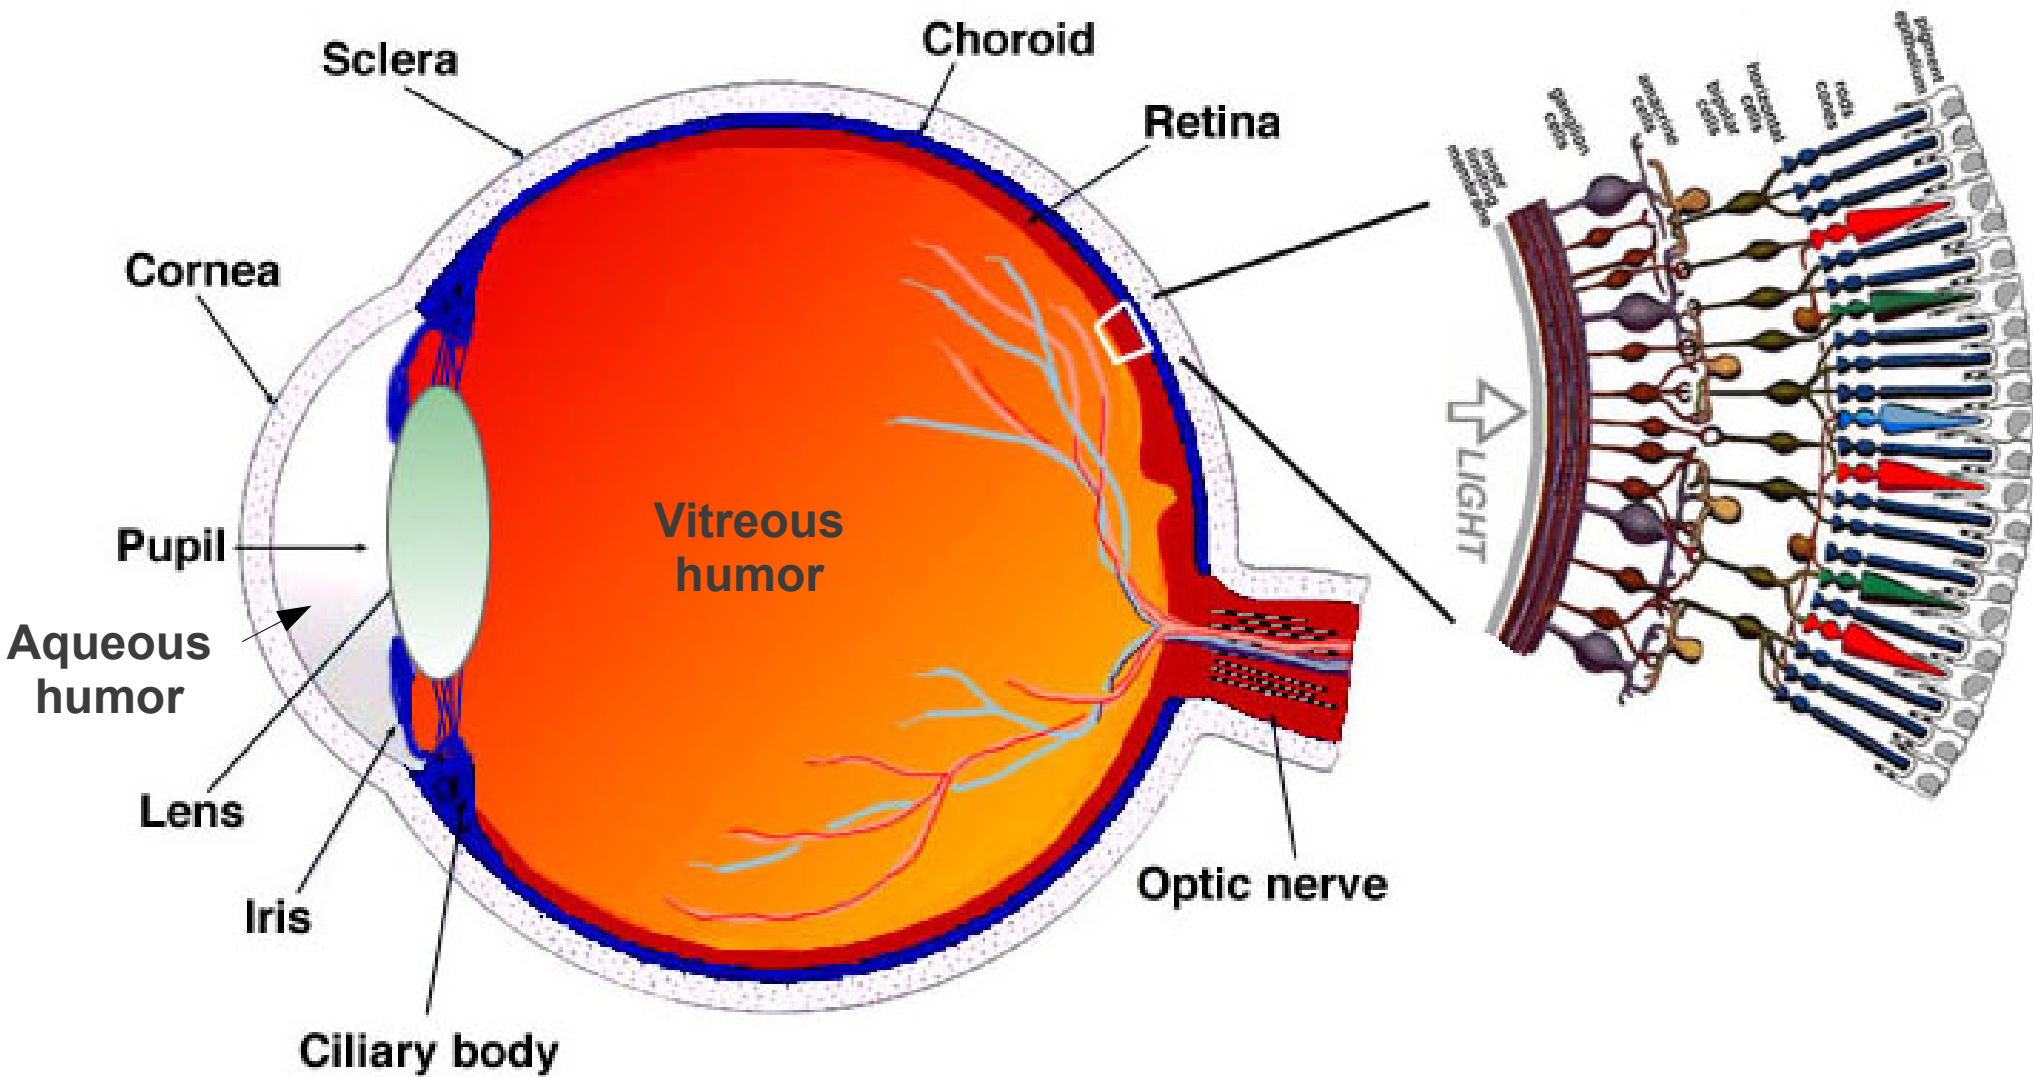

Supplementary Material for
PHY1308 (General Physics -
Electricity and Magnetism)

ANNOUNCEMENTS

- Homework 12:
 - Due Monday, May 2 by 5pm
 - Contains two "quiz problems" - do both, only one will be (randomly) graded. That's your quiz 9 grade.
 - TAs + Prof. not allowed to offer help on these problems

FINAL EXAM (MAY 5)

- Multiple choice, true/false, and problems
 - expect about 4-5 problems and about 20 multiple choice and true false
 - You get 2 sheets for your formula sheet
- The Deal
 - Everybody messes up an exam now and then
 - 3 of the problems will be directed only at material from exams 1, 2, and 3
 - Do better on the problem that corresponds to your lowest in-class exam grade, and your lowest in-class exam grade will be replaced by the grade on the relevant problem

Photograph of the back of my left eye

*Scale
Model
of Eye*

From the lensmaker equation, for a thick lens where $R_1 > 0$ and $R_2 < 0$ (double-convex)

$$\frac{1}{f} = (n - 1) \frac{2}{R} \quad \rightarrow \text{Large radius of curvature} = \text{large focal length} = \text{less "power" to focus}$$

Near-sighted: cannot see distant objects

Near-sighted: corrective optics

Location of virtual image from corrective diverging lens ($s' < O$), which the eye can then see

Near-sighted individuals need corrective optics that make objects look closer than they actually are so that the eye can focus on them.

Far-sighted: cannot see close objects

Far-sighted: corrective optics

Location of virtual image from corrective converging lens ($s' < O$), which the eye can then see. Virtual image is further away than object.

Far-sighted individuals need corrective optics that make objects look further away than they actually are so that the eye can focus on them.

LASIK

(laser-assisted in situ keratomileusis)
