

Linear Oscillations :

Following: Newton - Mechanics

Simple Harmonic Motion

$$F = ma$$
$$-Kx = m \ddot{x}$$

$$m \ddot{x} + Kx = 0$$

Guess: $x(t) = e^{\lambda t}$

Then $\dot{x} = \lambda e^{\lambda t} = \lambda x$

$$\ddot{x} = \lambda^2 e^{\lambda t} = \lambda^2 x$$

$$m \ddot{x} + Kx = 0$$

$$(m \lambda^2 + K) x = 0$$

$$\lambda^2 = -\frac{K}{m}$$

$$\lambda = \pm i \sqrt{\frac{K}{m}} = \pm i \omega_0$$

with $\omega_0 = \sqrt{\frac{K}{m}}$

$$x = c_1 e^{+i\omega_0 t} + c_2 e^{-i\omega_0 t}$$

Oscillating Solution

If we got the sign backwards

$$m \ddot{x} - Kx = 0$$

$$m \ddot{x} - Kx = 0$$

$$(m \lambda^2 - K) x = 0$$

$$\lambda^2 = +\frac{K}{m}$$

$$\lambda = \pm \sqrt{\frac{K}{m}} = \pm \omega_0$$

$$x = c_1 e^{+\omega_0 t} + c_2 e^{-\omega_0 t}$$

Exponentially Increasing Exponentially damped

Simple Harmonic Motion: Continued

$$X = C_1 e^{+i\omega_0 t} + C_2 e^{-i\omega_0 t}$$

$$v = \dot{X}$$

$$a = \ddot{X}$$

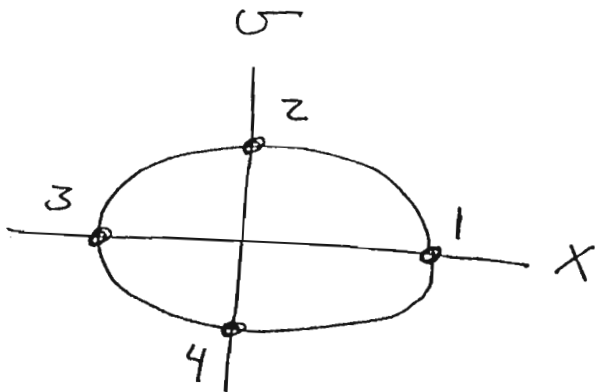

$$E = T + V = \frac{1}{2} m v^2 + \frac{1}{2} k x^2 = \text{constant}$$

Exercise

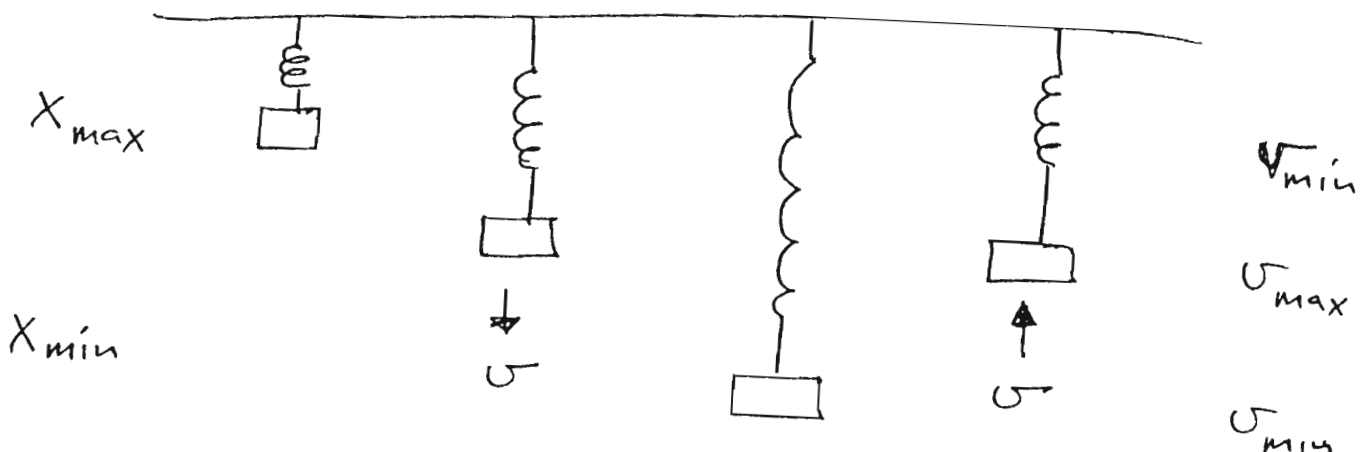

Phase Plot

Equation for circle: $x^2 + y^2 = r^2$

Energy Equation $\approx v^2 + X^2 = E^2$ (Loosely)

Position	X	v
1	+1	0
2	0	+1
3	-1	0
4	0	-1

SHO w/ Damping

3

$$m \ddot{x} + b \dot{x} + kx = 0$$

$$\omega_0 = \sqrt{\frac{k}{m}}$$

$$\ddot{x} + 2\beta \dot{x} + \omega_0^2 x = 0$$

$$\beta = \frac{b}{2m}$$

Guess: $x = e^{\lambda t}$

$$\dot{x} = \lambda x$$

$$\ddot{x} = \lambda^2 x$$

$$\Rightarrow (\lambda^2 + 2\beta\lambda + \omega_0^2) x = 0$$

$$\lambda_{\pm} = -\beta \pm \sqrt{\beta^2 - \omega_0^2} \approx -\beta \pm i\omega_0$$

for $\beta \ll \omega_0$

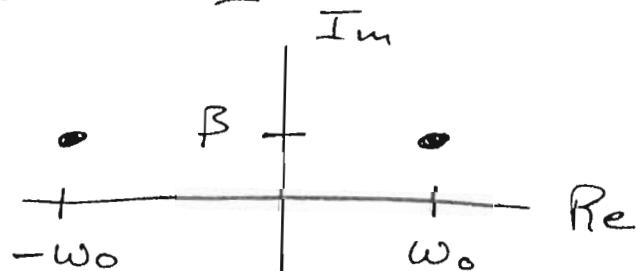

$$x(t) = c_1 e^{\lambda_+ t} + c_2 e^{\lambda_- t}$$

$$x(t) = e^{-\beta t} \left[c_1 e^{+t\sqrt{\beta^2 - \omega_0^2}} + c_2 e^{-t\sqrt{\beta^2 - \omega_0^2}} \right]$$

Limiting Case $\beta \ll \omega_0$

$$x(t) \approx e^{-\beta t} \left[c_1 e^{+i\omega_0 t} + c_2 e^{-i\omega_0 t} \right]$$

$$\lambda_{\pm} \approx i \left[i\beta \pm \omega_0 \right]$$

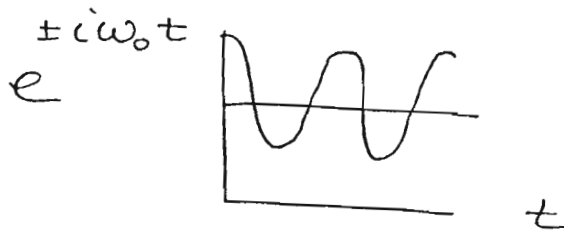

Note: $\beta = \frac{b}{2m}$ controls damping

$\omega_0 = \sqrt{\frac{k}{m}}$ controls oscillations

4

Note: It is important $\beta \geq 0$

Return to General case:

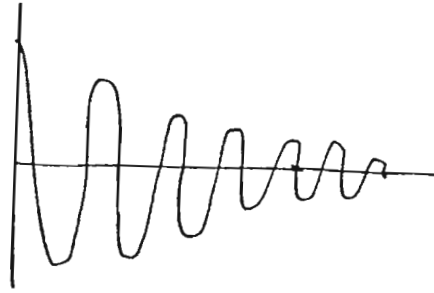

$$X(t) = e^{-\beta t} \left[c_1 e^{+t \sqrt{\beta^2 - \omega_0^2}} + c_2 e^{-t \sqrt{\beta^2 - \omega_0^2}} \right]$$

3 Cases to consider:

(Let: $\Omega = |\sqrt{\beta^2 - \omega_0^2}| \geq 0$)

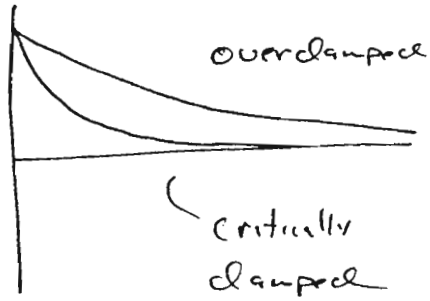

I. Underdamping	II. Critical damping	III. Over-damping
$\omega_0^2 > \beta^2$	$\omega_0^2 = \beta^2$	$\omega_0^2 < \beta^2$
$\sqrt{\beta^2 - \omega_0^2} = i\Omega$	$\sqrt{\beta^2 - \omega_0^2} = 0$	$\sqrt{\beta^2 - \omega_0^2} = \Omega$
$\lambda_{\pm} = -\beta \pm i\Omega$	$\lambda_{\pm} = -\beta + 0$	$\lambda_{\pm} = -\beta \pm \Omega$
λ_{\pm} complex	λ_{\pm} Real	λ_{\pm} Real

Under damped:

Overdamped

Critically Damped

Exercise

Next

How to solve :

$$m \ddot{x} + b \dot{x} + kx = F(t)$$

Linear Operators

Principle of Superposition:

Let \mathcal{L} be a linear operator.

Examples: $\left(m \frac{d^2}{dt^2} + b \frac{d}{dt} + k \right) x = 0$

or $(m D^2 + b D + k) x = 0$

or $D x = 0$ with $D = \frac{d}{dt}$

$$\mathcal{L}(x_1 + x_2) = \mathcal{L}(x_1) + \mathcal{L}(x_2)$$

Example:

$$D(x_1 + x_2) = \frac{d}{dt}(x_1 + x_2) = \frac{dx_1}{dt} + \frac{dx_2}{dt} = D x_1 + D x_2$$

Also

$$\mathcal{L}(\alpha x) = \alpha \mathcal{L}(x)$$

For α constant

Example:

$$D(\alpha x) = \frac{d}{dt}(\alpha x) = \alpha \frac{dx}{dt} = \alpha D(x)$$

We have already used this idea:

$$\mathcal{L}(x_1) = 0 \qquad (mD^2 + k)x_1 = (mD^2 + k)e^{+i\omega_0 t} = 0$$

$$\mathcal{L}(x_2) = 0 \qquad (mD^2 + k)x_2 = (mD^2 + k)e^{-i\omega_0 t} = 0$$

$$\mathcal{L}(x_1 + x_2) = 0 \qquad (mD^2 + k)(x_1 + x_2) = 0$$

$$(mD^2 + k) \left[c_1 e^{i\omega_0 t} + c_2 e^{-i\omega_0 t} \right] = 0$$

New idea:

$$\mathcal{L}(x_G) = 0 \qquad \text{General Solution}$$

$$\mathcal{L}(x_P) = F(t) \qquad \text{Particular Solution}$$

$$\mathcal{L}(x_G + x_P) = F(t)$$

Step 1) Find a particular solution: x_P

Step 2) Add any General solution: x_G

Non-Linear Operators :

Example: $X^2 + X + 1 = 0$

$\sin(x) = x$ $\overset{\infty}{X} + (\overset{\circ}{X})^2 = 0$

$$X^2 = a$$

Not linear: $N(x) = x^2$

$$N(x_1 + x_2) = (x_1 + x_2)^2 = x_1^2 + x_2^2 + 2x_1x_2 \neq N(x_1) + N(x_2)$$

Guess $X = e^{\lambda t}$ For $\overset{\infty}{X} + (\overset{\circ}{X})^2 = 0$

$$\overset{\infty}{X} + (\overset{\circ}{X})^2 = 0$$

$$\lambda^2 e^{\lambda t} + (\lambda e^{\lambda t})^2 = 0$$

$$\lambda^2 e^{\lambda t} + \lambda^2 e^{2\lambda t} = 0$$

$$e^{\lambda t} + e^{2\lambda t} = 0$$

$$1 + e^{\lambda t} = 0$$

$$e^{\lambda t} = -1 \quad \begin{matrix} \text{???} \\ \text{ooo} \end{matrix}$$

$$\Rightarrow X = e^{\lambda t} = -1$$

Non-sense

Particular Solution: Forced Oscillation:

$$(m D^2 + b D + k) x = m F e^{i \omega t}$$

$$(D^2 + 2\beta D + \omega_0^2) x = F e^{i \omega t}$$

$$\begin{cases} \omega_0 = \sqrt{\frac{k}{m}} \\ \beta = \frac{b}{2m} \end{cases}$$

Guess: $x = A e^{i \omega t}$

$$\overset{\circ}{x} = i \omega x$$

$$\overset{\circ\circ}{x} = -\omega^2 x$$

$$\circ\circ \Rightarrow (\omega_0^2 + 2i\beta\omega - \omega^2) A e^{i \omega t} = F e^{i \omega t}$$

$$\circ\circ \quad A = \frac{F}{(\omega_0^2 + 2i\beta\omega - \omega^2)} = \frac{-F}{(\omega - \omega_+)(\omega - \omega_-)}$$

Note:
A is complex

where $\omega_{\pm} = i\beta \pm \sqrt{\omega_0^2 - \beta^2}$

$$\omega_{\pm} \approx i\beta \pm \omega_0 \quad \text{for } \beta \ll \omega_0$$

$$\circ\circ \quad x = A e^{i \omega t} = \frac{-F e^{i \omega t}}{(\omega - \omega_+)(\omega - \omega_-)}$$

Optional: $A = |A| e^{i\delta}$

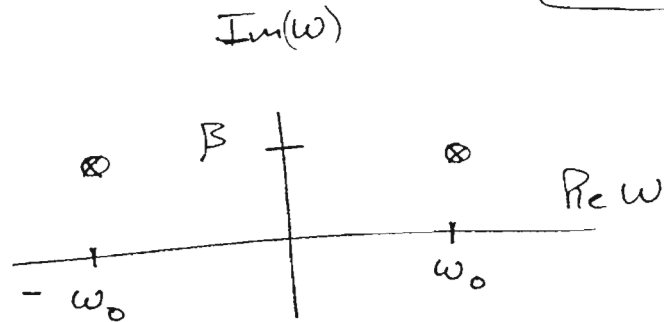

$$\circ\circ \quad x = |A| e^{i(\omega t + \delta)}$$

Phase δ :

Resonance: $\Delta\delta = +\pi/2 \rightarrow -\pi/2$

Resonance Structure :

$$X_P = \frac{-F e^{i\omega t}}{(\omega - \omega_+)(\omega - \omega_-)}$$

The particular solution:

$$\omega_{\pm} \approx i\beta \pm \omega_0$$

Recall the general structure:

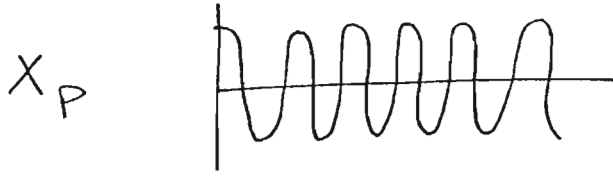

$$X_G = e^{-\beta t} \left\{ c_1 e^{+t\sqrt{\beta^2 - \omega_0^2}} + c_2 e^{-t\sqrt{\beta^2 - \omega_0^2}} \right\}$$

Not present in particular solution

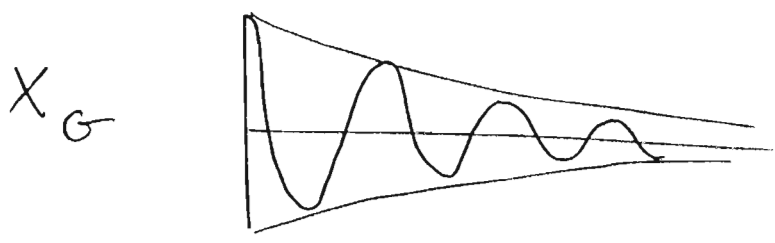

Full Solution

$$X_P + X_G$$

Annotations: An arrow points from X_P to the text "No decay". Another arrow points from X_G to the text "exponential decay".

- No decay
- Frequency ω determined by driving source

- Exponential Decay (Transient)
- Frequency $\sim \omega_0$ determined by system - resonance

Forced Oscillations

Instead of $e^{i\omega t}$ = 

try $\theta(t) =$  = $\begin{cases} 0 & t < 0 \\ 1 & t > 0 \end{cases}$

What to do ???

Idea:

- $\mathcal{L}(x_1) = 0$
 - $\mathcal{L}(x_2) = 0$
 - $\mathcal{L}(x_3) = c_3 e^{i\omega_3 t}$
 - $\mathcal{L}(x_4) = c_4 e^{i\omega_4 t}$
- } General Solutions
- } Particular Solutions

Thus: $\mathcal{L}(x_1 + x_2 + x_3 + x_4) = c_3 e^{i\omega_3 t} + c_4 e^{i\omega_4 t}$

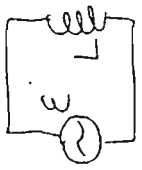

Can we make this into the function we need?

In General:

$$\mathcal{L}(c_1 x_1 + c_2 x_2 + \dots) = c_1 F_1 + c_2 F_2 + \dots$$

$$\mathcal{L}\left(\sum_{n=1}^{\infty} c_n x_n\right) = \sum_{n=1}^{\infty} c_n F_n$$

Inductor

$$\mathcal{E} = L \frac{dI}{dt}$$

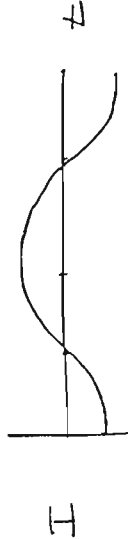

Then $dI = \frac{\mathcal{E}}{L} dt$
 Integrate: $I = \int \frac{\mathcal{E}}{L} dt$

Let $\mathcal{E}(t) = \mathcal{E}_{max} \sin(\omega t)$

$$I(t) = -\frac{\mathcal{E}_{max}}{\omega L} \cos(\omega t) = -I_{max} \cos(\omega t)$$

with $I_{max} = \frac{\mathcal{E}_{max}}{\omega L} \equiv \frac{\mathcal{E}_{max}}{X_L}$

with $X_L = \omega L$

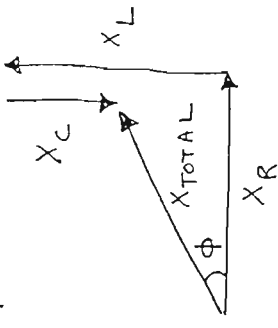

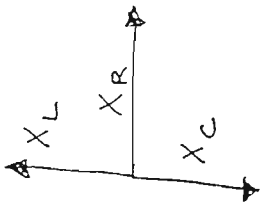

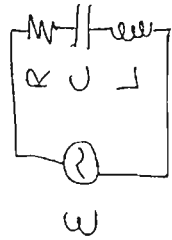

ELI

Summary: $RI = V \Rightarrow I = \frac{\mathcal{E}}{X}$

- Resistor $X_R = R$ I and \mathcal{E} are in phase
- Capacitor $X_C = \frac{1}{\omega C}$ $I \text{ } \mathcal{E}$
- Inductor $X_L = \omega L$ $\mathcal{E} \text{ } I$

LC

Put together | RLC (circuit)

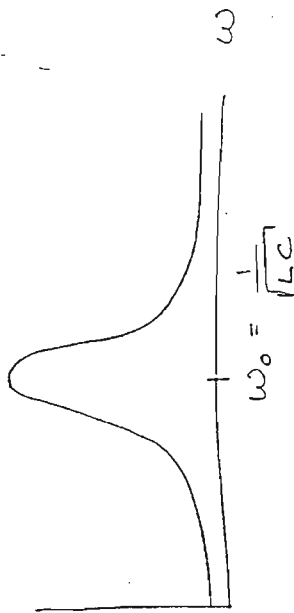

Add them up

$$Z = X_{TOTAL} = \sqrt{X_R^2 + (X_L - X_C)^2} = \sqrt{R^2 + (\omega L - \frac{1}{\omega C})^2}$$

$$\tan \phi = \frac{X_L - X_C}{X_R}$$

$RI = V$
 $ZI = \mathcal{E} \Rightarrow I = \frac{\mathcal{E}}{Z}$

$I_{max} = \frac{\mathcal{E}_{max}}{Z}$

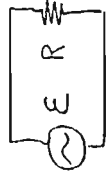

AC Circuits:
Physics 1403

Professor Olness
April 1993

Capacitor $\sqrt{2}$

Resistor

$$RI = V = \mathcal{E}$$

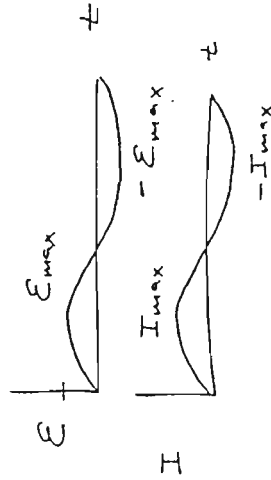

$$I = \frac{\mathcal{E}}{R}$$

Let $\mathcal{E}(t) = \mathcal{E}_{\max} \sin(\omega t)$

Then $I(t) = \frac{\mathcal{E}(t)}{R} = \frac{\mathcal{E}_{\max}}{R} \sin(\omega t)$

∴ $I(t) = I_{\max} \sin(\omega t)$

where $I_{\max} = \mathcal{E}_{\max}/R$

$$\mathcal{E} = \frac{Q}{C}$$

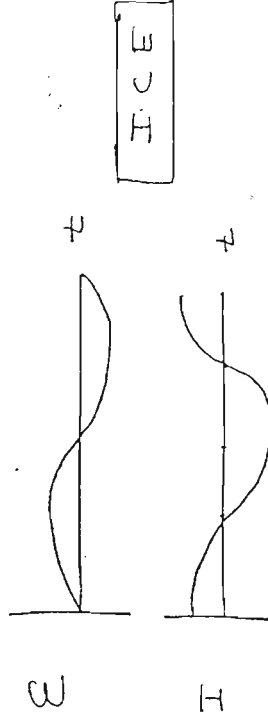

$$\frac{d\mathcal{E}}{dt} = \frac{1}{C} \frac{dQ}{dt} = \frac{1}{C} I$$

Let $\mathcal{E}(t) = \mathcal{E}_{\max} \sin(\omega t)$

$I(t) = C \frac{d\mathcal{E}(t)}{dt} = C \mathcal{E}_{\max} \omega \cos(\omega t)$

∴ $I(t) = I_{\max} \cos(\omega t)$

with $I_{\max} = \mathcal{E}_{\max} (\omega C)$

Note: to make above look like resistor case

define $X_C = \frac{1}{\omega C}$

Then for resistor: $I_{\max} = \frac{\mathcal{E}_{\max}}{R}$

For capacitor: $I_{\max} = \frac{\mathcal{E}_{\max} \omega C}{X_C}$

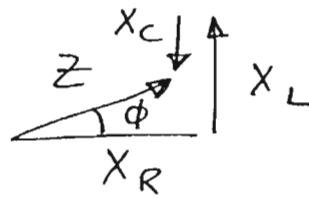

Resonances:

RLC Circuit:

Recall

ELI
ICE

$$X_R = R$$

$$X_L = \omega L$$

$$X_C = \frac{1}{\omega C}$$

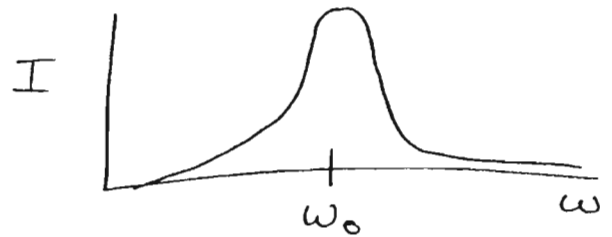

$$Z^2 = R^2 + (X_L - X_C)^2$$

$$RI = V \Rightarrow ZI = \mathcal{E}$$

$$\tan \phi = \frac{X_L - X_C}{X_R}$$

Resonant Frequency:

$$\omega_0 = \frac{1}{\sqrt{LC}}$$

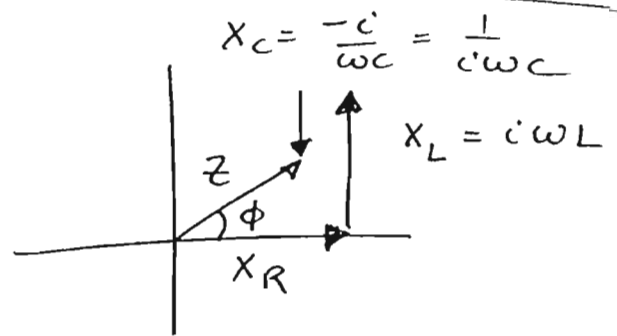

Idea: Use Complex #'s

$$X_R = R$$

$$X_L = i\omega L$$

$$X_C = \frac{1}{i\omega C} = \frac{-i}{\omega C}$$

$$Z = X_R + X_L + X_C$$

$$Z = R + i\omega L + \frac{1}{i\omega C}$$

$$I = \mathcal{E}/Z \quad : \text{ Peak when } Z = 0$$

$$Z = 0 \Rightarrow \omega_{\pm} = iP \pm \sqrt{\omega_0^2 - P^2}$$

$$\left\{ \begin{array}{l} P = \frac{R}{2L} \\ \omega_0 = \frac{1}{\sqrt{LC}} \end{array} \right.$$

$$\omega_{\pm} \approx iP \pm \omega_0 \quad \text{for small } P$$

Complex ω plane

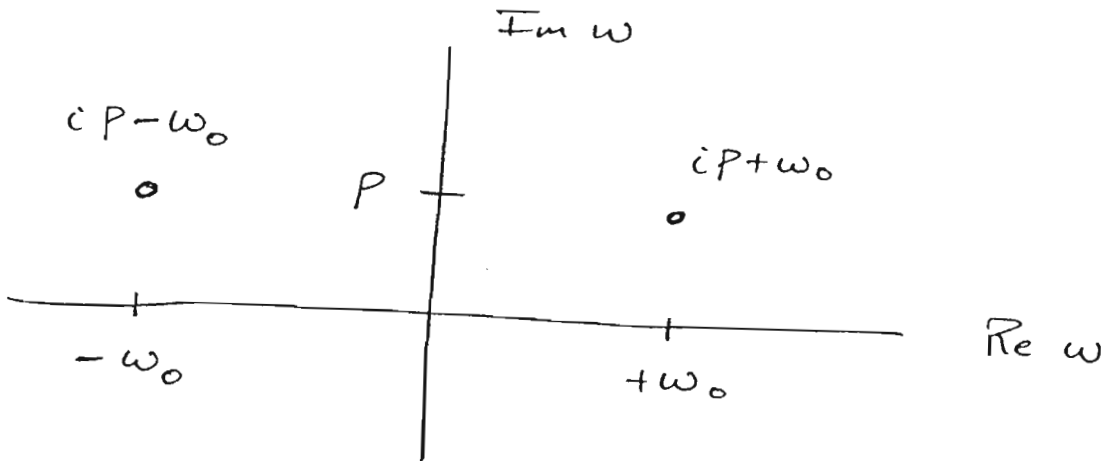

2

$$Z = R + i\omega L + \frac{1}{i\omega C}$$

$$Z = \frac{iL}{\omega} (\omega - \omega_+) (\omega - \omega_-)$$

$$\therefore \underline{I} = \frac{\Sigma}{Z} = \Sigma \frac{\omega}{iL} \frac{1}{(\omega - \omega_+) (\omega - \omega_-)}$$

with $\omega_{\pm} = iP \pm \omega_0$

$$\omega_0 = \frac{1}{\sqrt{LC}} \quad \text{Resonant Frequency}$$

$$P = \frac{R}{ZL} \quad \text{Resonant width}$$
