This exam is worth 100 points. It consists of 13 multiple-choice questions worth 6 points each and a partial credit section worth a maximum of 22 points.

Don't get hung up on the questions. They should only take a few minutes each. If you find yourself spending more than a few minutes on a question you are probably looking at it the wrong way. You should skip it temporarily and return to it later.

NOTE - The equation sheets are on the last pages. If you think that it makes referring to them easier, you can remove them from the rest of the exam.

Partial Credit Section (22 points)

A block of mass $m=0.4$ kg initially compresses a spring of spring constant $k=10000$ N/m a distance $x=0.1$ m. The block is released from rest at point A and slides over a smooth surface fashioned into a circular loop of radius $R=1.5$ m. The surface is rough only between points C and D, where $\mu_k=0.3$ for a distance of $d=2.5$ m. Then the block climbs a smooth slope inclined at an angle $\theta=20^\circ$ to the horizontal and comes to a stop at a height h above the horizontal.

It would be prudent to use variables as much as possible and only substitute numbers in at the very end of each part.

What is the speed of the block at point B, V_B ? (4 points)

What is the speed of the block at point C, V_C ? (3 points)

What is the force of the slope on the block at point E? (3 points)

In words, what is the action-reaction partner to the force of the slope on the block at point E?
(2 points)

How high does the block rise, h , before coming to rest at point E? (3 points)
