1) It is a very hot day in Dallas, and the speed of sound is 400 m/s. Given the formula,

\[ v = 332 \left( \frac{\text{m}}{\text{s}} \right) + 0.6 \left( \frac{\text{m}}{\text{s} \circ \text{C}} \right) T, \]

determine the present temperature in Celsius. (We will use \( v_{\text{sound}} = 400 \text{ m/s} \) for the prelab exercise ONLY to make the numbers come out nicely.)

2) OPEN PIPE: Draw the resonant standing wave patterns corresponding to the lowest 3 frequencies of an OPEN pipe. (You may draw pressure or displacement—your choice.)

\[
\begin{aligned}
L &= \frac{\lambda}{2} \\
L &= \frac{\lambda}{2} \\
L &= \frac{\lambda}{2}
\end{aligned}
\]

You should observe a pattern. We will now calculate the frequency.

If \( L = \frac{N}{2} \lambda \) where \( N = 1, 2, 3, \ldots \) then \( \lambda = \frac{N}{2L} \). Using \( v = f\lambda \), we have:

\[
f = \frac{v}{\lambda} = \frac{Nv}{2L}
\]

Use this formula, with \( v_{\text{sound}} = 400 \text{ m/s} \) to compute the first 3 resonant frequencies. For the length of the pipe use \( L = 1 \text{ m} \).
3) CLOSED PIPE: Draw the resonant standing wave patterns corresponding to the lowest 3 frequencies of a CLOSED pipe. (You may draw pressure or displacement–your choice.)

![Diagrams of resonant standing waves]

You should observe a pattern. We will now calculate the frequency.
If \( L = \frac{N}{4} \lambda \) where \( N = 1, 2, 3, \ldots \), then \( \frac{1}{\lambda} = \frac{N}{4L} \). Using \( v = f \lambda \), we have:

\[
f = \frac{v}{\lambda} = \frac{Nv}{4L}
\]

Use this formula, with \( v_{\text{sound}} = 400 \text{ m/s} \) to compute the first 3 resonant frequencies. For the length of the pipe use \( L = 1 \text{ m} \).

4) COMPARISON:
Fill in the following tables. (Yeah, we only calculated the first 3 resonances, but you’re smart and can figure out the pattern–we make use of this in the lab.)

<table>
