Dallas, TX, USA

SEPTEMBER 10, 2018

SMU | DEDMAN COLLEGE  
OF HUMANITIES & SCIENCES

## Outline

**The Standard Model**

**The Large Hadron Collider and the ATLAS Experiment**

**The Higgs-Bottom Quark Landscape**

Within the Standard Model

Beyond the Standard Model

**Future Directions**

**Appendix**

Theoretical Motivation

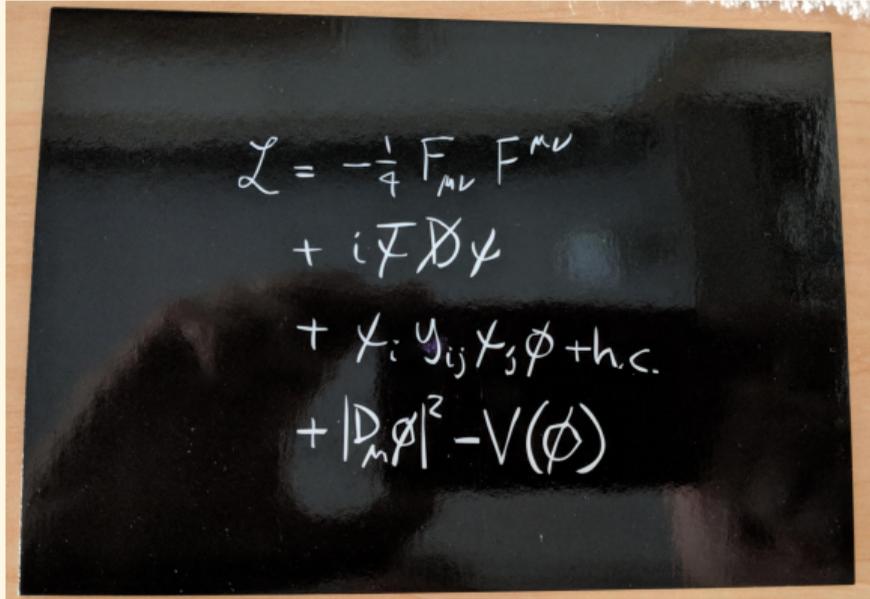

$$\mathcal{L} = \bar{\psi} \gamma^\mu \not{D} \psi - \frac{1}{4} F_{\mu\nu} F^{\mu\nu}$$

# The Standard Model: A Ridiculous Primer

$$+ \chi_i^\dagger Y_{ij} \chi_j \phi + \text{h.c.}$$

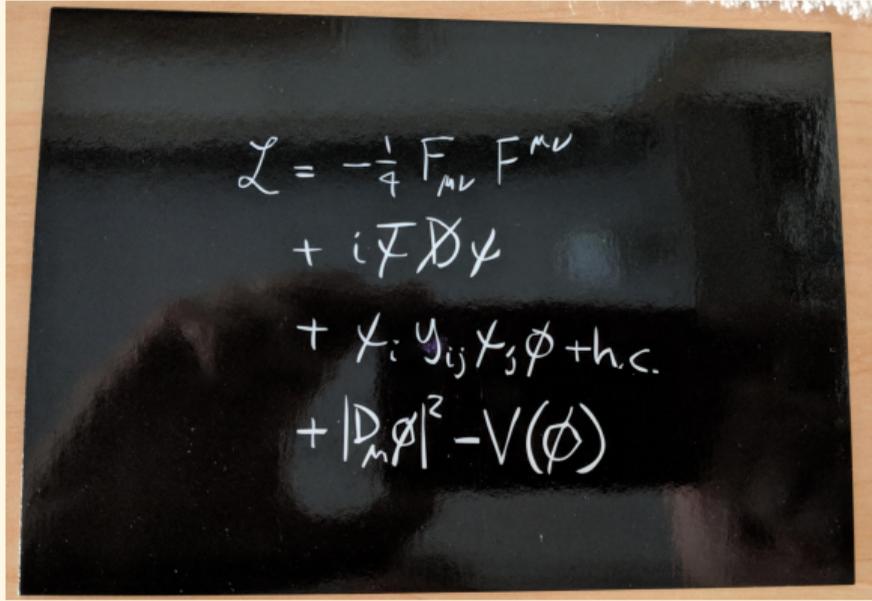

$$+ |D_\mu \phi|^2 - V(\phi)$$

## Higgs-Quark Interactions in the Standard Model

$$\begin{aligned}\mathcal{L} = & -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \\ & + i\bar{\psi} \not{D} \psi \\ & + \sum_i \sum_j Y_{ij} \bar{\psi}_i \psi_j \phi + \text{h.c.} \\ & + |D_\mu \phi|^2 - V(\phi)\end{aligned}$$

One key parameter of the standard model is the Higgs mass, measured to be  $m_H = (124.97 \pm 0.24)$  GeV using ATLAS and CMS Experiment data from 2010-2016.

## Higgs-Quark Interactions in the Standard Model

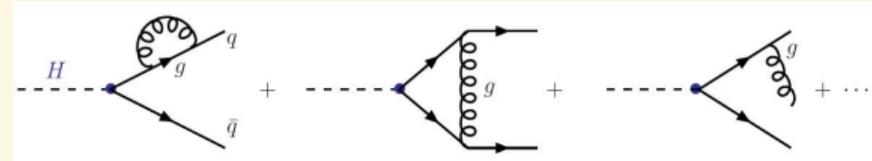

$$\begin{aligned}
 \mathcal{L} = & -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \\
 & + i\bar{\psi} \not{D} \psi \\
 & + \sum_i \sum_j Y_{ij} \bar{\psi}_i \psi_j \phi + \text{h.c.} \\
 & + |D_\mu \phi|^2 - V(\phi)
 \end{aligned}$$

One key parameter of the standard model is the Higgs mass, measured to be  $m_H = (124.97 \pm 0.24)$  GeV using ATLAS and CMS Experiment data from 2010-2016.

## Higgs-Quark Interactions in the Standard Model

$$\begin{aligned} \mathcal{L} = & -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \\ & + i\bar{\psi} \not{D} \psi \\ & + \sum_i \sum_{ij} Y_{ij} \bar{\psi}_i \psi_j \phi + \text{h.c.} \\ & + |D_\mu \phi|^2 - V(\phi) \end{aligned}$$

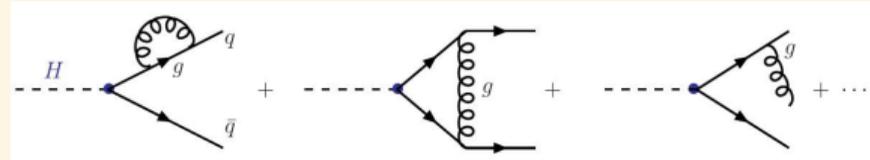

One key parameter of the standard model is the Higgs mass, measured to be  $m_H = (124.97 \pm 0.24)$  GeV using ATLAS and CMS Experiment data from 2010-2016.

## Higgs-Quark Interactions in the Standard Model

$$\begin{aligned} \mathcal{L} = & -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \\ & + i\bar{\psi} \not{D} \psi \\ & + \sum_i y_{ij} \bar{\psi}_i \psi_j \phi + h.c. \\ & + |D_\mu \phi|^2 - V(\phi) \end{aligned}$$

One key parameter of the standard model is the Higgs mass, measured to be  $m_H = (124.97 \pm 0.24)$  GeV using ATLAS and CMS Experiment data from 2010-2016.

The partial width of the Higgs decay to (heavy) quarks can be written as [1]:

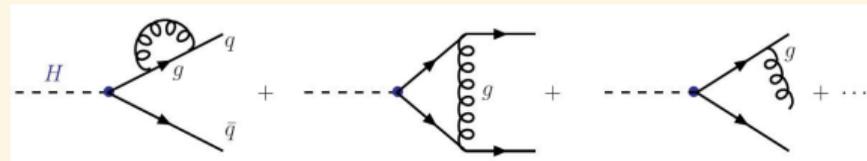

$$\Gamma(H \rightarrow q\bar{q}) = \frac{3G_\mu}{4\sqrt{2}\pi} M_H \bar{m}_q^2(M_H) \left[ 1 + \Delta_{qq} + \Delta_H^2 \right]$$

where  $\Delta_{qq}$  and  $\Delta_H$  hide all the corrections due to the strong coupling constant, Higgs mass, and most quark properties.

## Higgs-Quark Interactions in the Standard Model

$$\begin{aligned} \mathcal{L} = & -\frac{1}{4} F_{\mu\nu} F^{\mu\nu} \\ & + i\bar{\psi} \not{D} \psi \\ & + \sum_i Y_{ij} \bar{\psi}_i \psi_j \phi + h.c. \\ & + |D_\mu \phi|^2 - V(\phi) \end{aligned}$$

One key parameter of the standard model is the Higgs mass, measured to be  $m_H = (124.97 \pm 0.24)$  GeV using ATLAS and CMS Experiment data from 2010-2016.

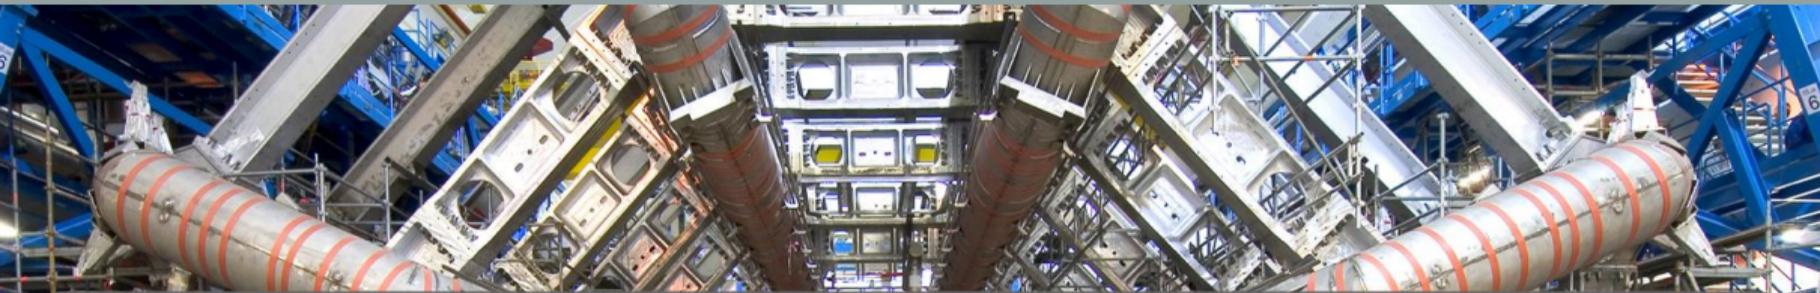

The partial width of the Higgs decay to (heavy) quarks can be written as [1]:

$$\Gamma(H \rightarrow q\bar{q}) = \frac{3G_\mu}{4\sqrt{2}\pi} M_H \bar{m}_q^2(M_H) \left[ 1 + \Delta_{qq} + \Delta_H^2 \right]$$

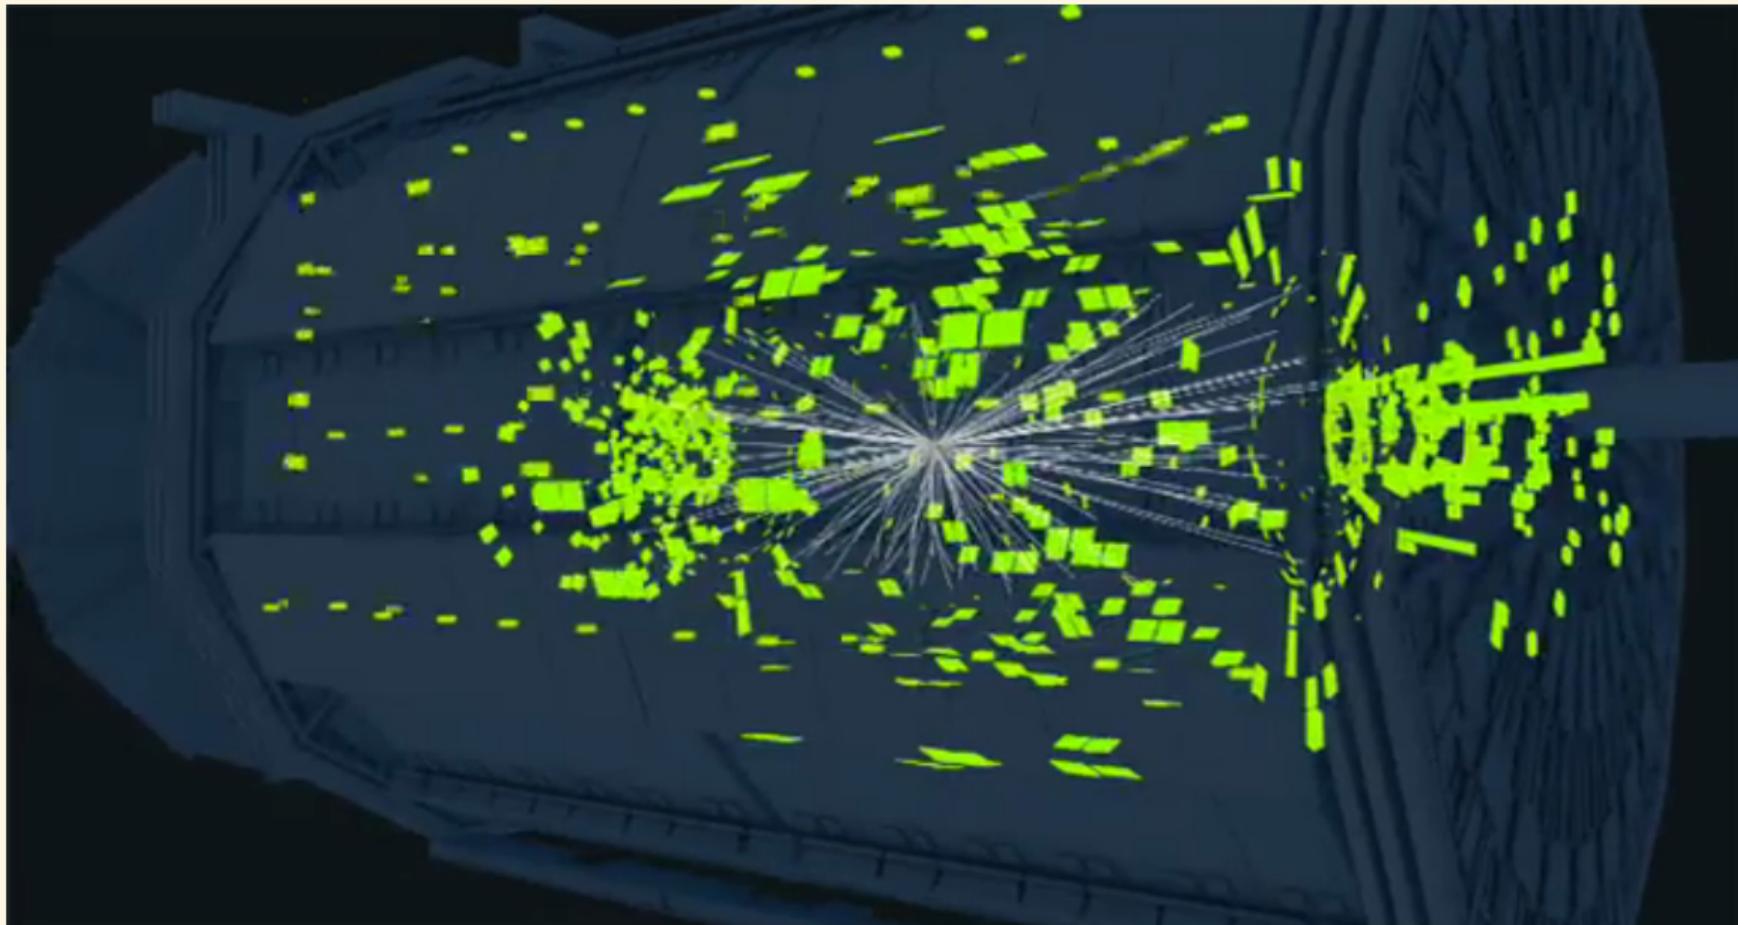

where  $\Delta_{qq}$  and  $\Delta_H$  hide all the corrections due to the strong coupling constant, Higgs mass, and most quark properties.

The rate of  $H^0 \rightarrow b\bar{b}$  is expected to be about 60%, and is the single-largest decay mode of the Higgs particle. It went unobserved in earlier LHC data due to the difficulty of identifying this Higgs decay.

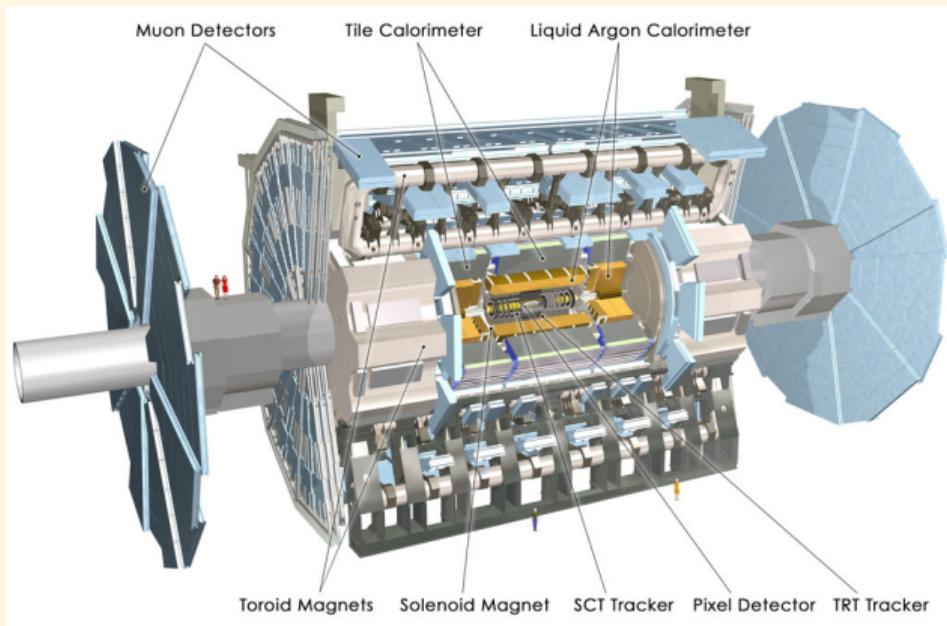

# The Large Hadron Collider and the ATLAS Experiment

## The ATLAS Detector — Schematic Overview

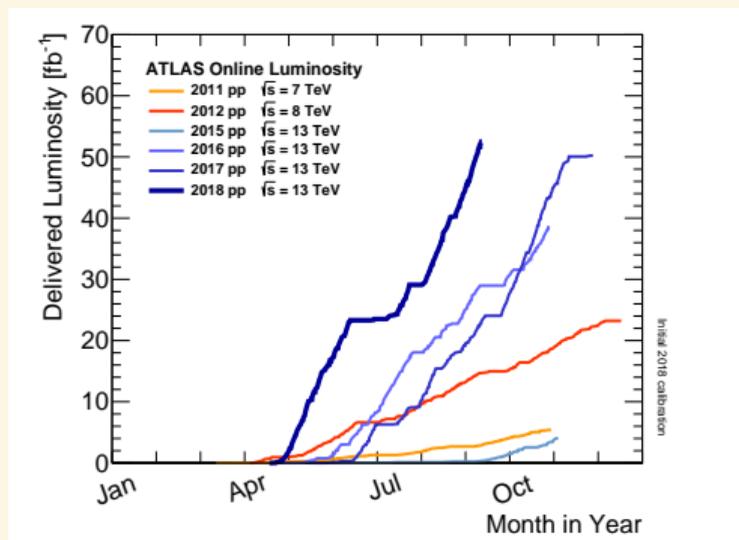

### Major SMU contributions:

- ▶ Liquid Argon Calorimeter
  - ▶ Original readout electronics, Phase I and Phase II upgrade readout electronics
  - ▶ Operations and Monitoring
- ▶ Trigger/Data Acquisition
  - ▶ Data Quality Monitoring Framework
  - ▶ Core Software Development and Maintenance
  - ▶ **Trigger Rate Prediction Monitoring**
  - ▶ **Bottom-quark-initiated jet triggers and online track reconstruction systems**

(bold items are places where my students, post-doctoral researchers, and I have played/are playing major roles; bold-underlined are active and ongoing contributions)

## $p - p$ Collision Data Collected by the ATLAS Experiment

A rough way of use the chart:

$$L \times \sigma = N \quad (1)$$

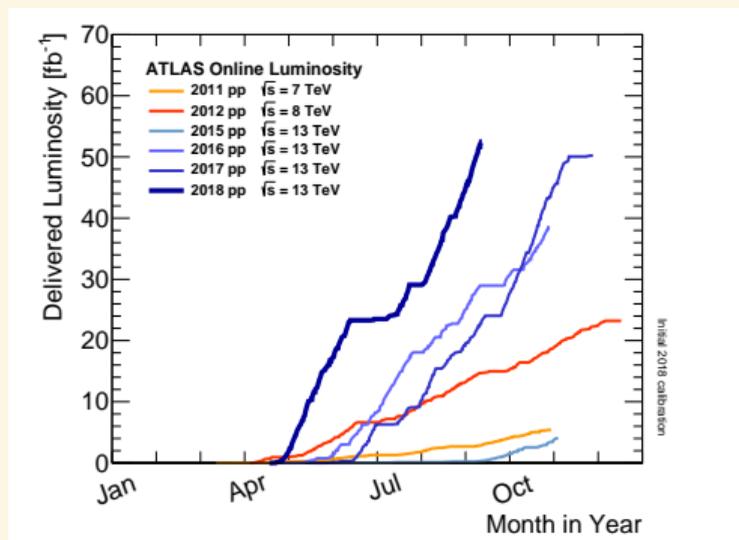

Read integrated luminosity ( $L$ ) off chart at any time; get  $\sigma$ , the prediction of the cross-section of a physical process, from your friendly neighborhood theorist (e.g.

$\sigma(pp \rightarrow H) \approx 60 \times 10^3 \text{fb}$  at  $\sqrt{s} = 13 \text{TeV}$ ).

Estimate the number of occurrences of that process in your data set. For example, for each  $1 \text{fb}^{-1}$  the LHC produces  $60 \times 10^3$  Higgs bosons at  $\sqrt{s} = 13 \text{TeV}$ .

For the current running period, 2015-2018, we anticipate having  $\sim 150 \text{fb}^{-1}$ , which would give us access to  $\sim 9$  million Higgs particles — this is just what the collider would deliver, not what we would capture with ATLAS.

# The Higgs-Bottom Quark Landscape

## 2010-2012: The Run 1 LHC Perspective on Higgs Couplings

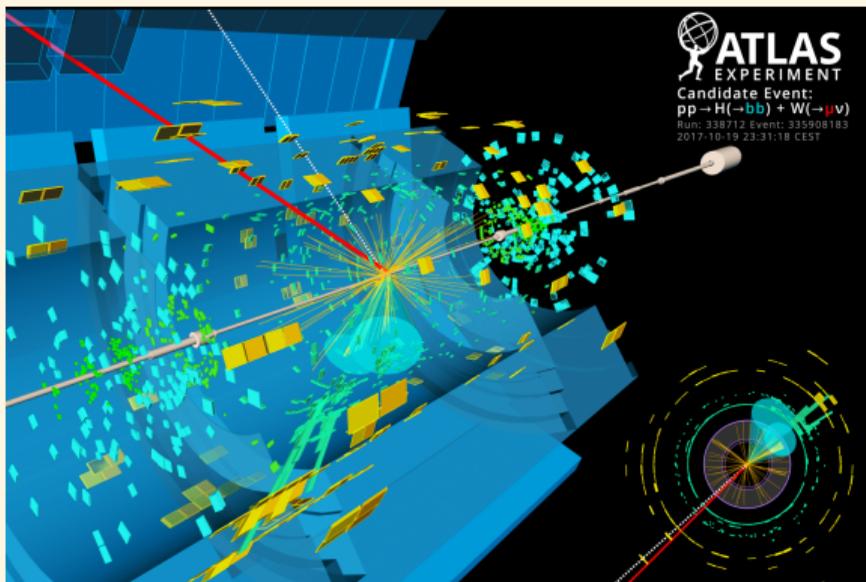

We learned about the bottom-quark and Higgs interaction in Run 1 [2] without ever laying eyes, reliably, on a single Higgs particle decaying to bottom quarks (e.g.  $H^0 \rightarrow b\bar{b}$ ). This was done via quantum mechanical processes like this:

where bottom quarks “running in the loop” influence the rate of the above process, and have consequences for how often we observed Higgs bosons being produced in Run 1.

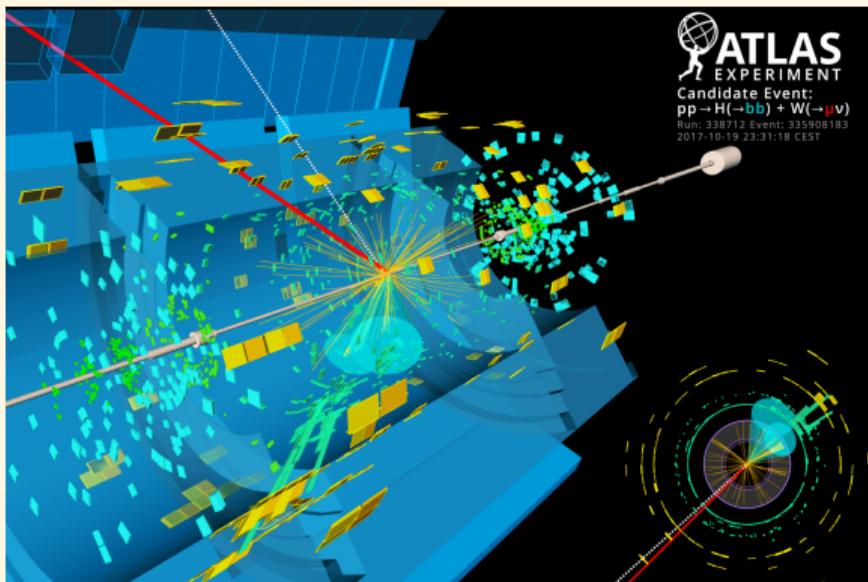

## 2015-2018: Run 2 and the “Edge of a Major Success”

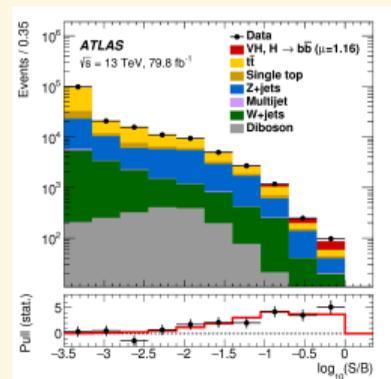

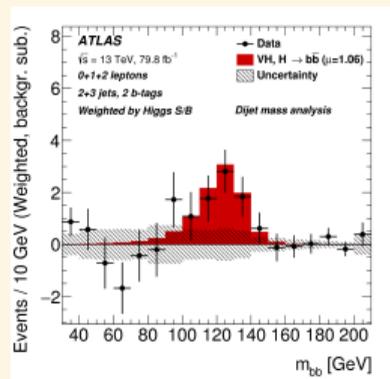

The “gold-plated” approach to direct observation of  $H^0 \rightarrow b\bar{b}$  is  $pp \rightarrow (W, Z)H^0$  with  $W \rightarrow \ell^+\nu$ ,  $Z \rightarrow \nu\bar{\nu}$ , or  $Z \rightarrow \ell^+\ell^-$  [3, 4]. By itself, this method is still not definitive but is rapidly approaching that point.

SMU has contributed to discovery by this approach via software framework development and leadership (e.g. speeding development through automated builds of the “Hbb” analysis software and improved analysis software) and improved modeling of a major background process,  $pp \rightarrow t\bar{t}$ . *PH.D. THESIS: PEILONG WANG*

# $H \rightarrow b\bar{b}$ as a tool for new discoveries: “The Tail of the Higgs” and other stories

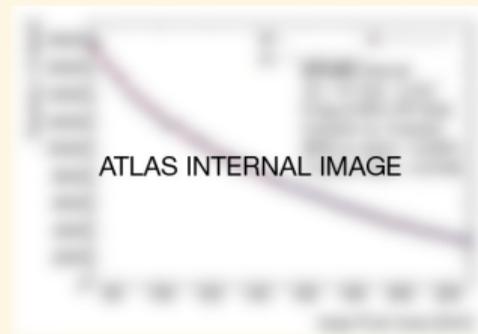

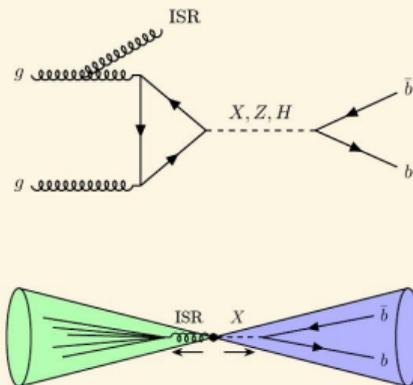

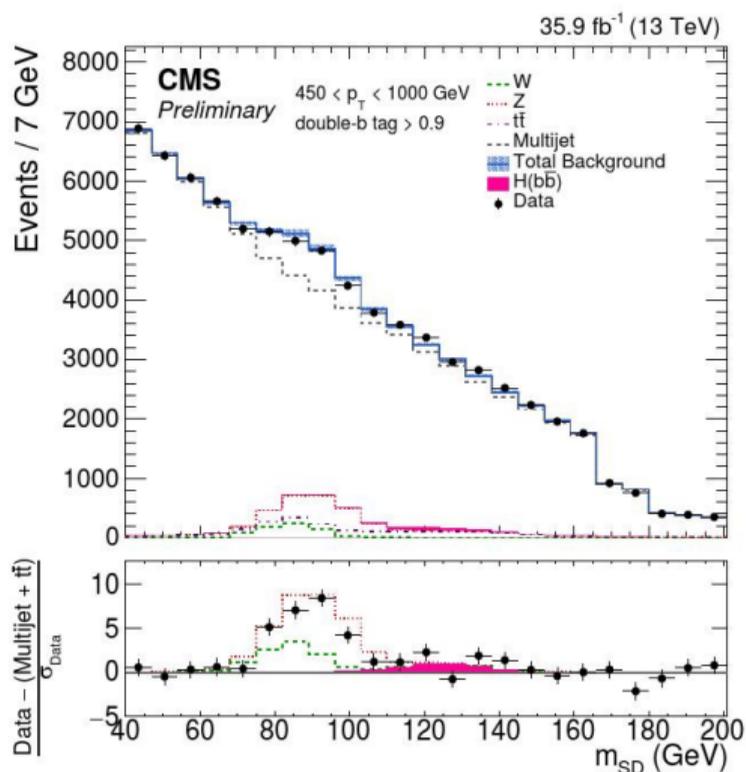

SMU partnered with the SLAC National Accelerator Laboratory to pioneer this analysis in ATLAS, recognizing that there are significant physics improvements to be made in this analysis to improve its scope (e.g. addition of top quark resonances from  $t\bar{t}$  and single-top production. *PH.D. THESIS: MATTHEW FEICKERT*)

# Future Directions

## So Much To Say

Every one of the items below is an area where a student could walk in and get started on something of importance to the future of Higgs physics.

- ▶ **Bottom-quark identification in dense environments:** as the LHC collision intensity climbs over the next 20 years, it will become more important to work harder to “tag” the presence of bottom quarks from Higgs decay in increasingly information-dense environments.
  - ▶ “Xbb” tagging, quark/gluon jet-tagging, charm tagging, hadron-level tagging, deep learning applications in jet identification
- ▶ **Bottom-quark-initiated jet triggers:** Heavy quarks and signs of new physics may go hand-in-hand; securing data with such signatures right at the time of data-taking grows in importance over the next 20 years.
  - ▶ Implementation of new jet-tagging algorithms in the online system, use of the new hardware-based charged particle reconstruction systems (FTK and HTT), deployment of algorithms in the new ATLAS framework (“AthenaMT”), physics needs and impact of design choices.

## So Much To Say

  - ▶ Implementation of new jet-tagging algorithms in the online system, use of the new hardware-based charged particle reconstruction systems (FTK and HTT), deployment of algorithms in the new ATLAS framework (“AthenaMT”), physics needs and impact of design choices.

## So Much To Say (II)

Every one of the items below is an area where a student could walk in and get started on something of importance to the future of Higgs physics.

- ▶  $H^0 \rightarrow b\bar{b}$  **as a tool**: we will have definitively established the Higgs-bottom quark coupling as directly observable at the conclusion of Run 2 data analysis (ca. 2019-2020)
  - ▶ increased emphasis on probing rare Higgs production processes now that its largest decay mode is reliably established, use of this decay mode for a new round of Higgs property measurements, and emphasis on using this decay mode to distinguish Higgs decays from possible new particles/signatures involving bottom quarks (the “Higgs as background” problem)

## So Much To Say (II)

Every one of the items below is an area where a student could walk in and get started on something of importance to the future of Higgs physics.

- ▶  $H^0 \rightarrow b\bar{b}$  **as a tool**: we will have definitively established the Higgs-bottom quark coupling as directly observable at the conclusion of Run 2 data analysis (ca. 2019-2020)

## THE ATLAS EXPERIMENT AT SMU

### What is ATLAS?

ATLAS stands for "A Toroidal LHC Apparatus" and is one of four major physics detectors ever constructed, standing eight stories tall, with a length half that of a U.S. football field, and weighing in at over 7000 tons. It is designed to take 40 million pictures per second of proton-proton collisions delivered by the LHC. These collisions recreate conditions in the universe about a billionth of a second after the universe came into being - an event known as "The Big Bang". By studying these collisions, we are learning about the laws of physics and the constituents of the universe just a tiny fraction of a second after it appeared. By doing so, we hope to learn about the fundamental structure of energy, matter, space, and time so that we can better understand the universe as it was, as it is now, and as it will be in the future.

The videos in the above playlist will let you learn more about the ATLAS Experiment and the people that make it possible.

### SMU ATLAS Contributions

<https://www.physics.smu.edu/web/research/atlas.html>

# My ATLAS Research Page

Higgs studies of both  $h \rightarrow 4b$  and  $pp \rightarrow 2b\gamma$ . The results were presented for the first time at 2018 International Conference on High Energy Physics (ICHEP) in Korea.

- PHI 4p 13 349H (2017):** Precision Higgs boson cross-sections at Run-2. *Submitted to Summer for ATLAS Annual – 2018*: substructure and physics usage. Rebecca Hahn has created a Research Scholar Award to support her summer research with the SMU ATLAS Group. Rebecca will explore the details of gluon splitting in the context of LHC physics, and consider new ideas in the study of decay of the Higgs boson when only bottom quarks appear in the final state.

## Current and Past Collaborators

### Current Collaborators

**Matthew Tarkenton**  
PHD Candidate

2018 Present: Study of ATLAS Four Tracker (FTK) tracks in the development of better track reconstruction algorithms to improve the ATLAS High-Level Trigger (HLT) physics analysis efficiency. Focus on the development of algorithms to model and correct the impact of track-pointing in the study of highly boosted  $B \rightarrow \gamma\gamma$  signals.

**Francesco I. Norio**  
Post-Doctoral Researcher

2017 Present: Optimization of online RecoTagging algorithms for bottom-quark-flavored jet triggers in the ATLAS High-Level Trigger and Higgs and heavy-flavor physics, with emphasis on the study of boosted  $B \rightarrow \gamma\gamma$ . He is the top-point contributor of the top quark identification paper in the ATLAS 2016 physics and development campaign to improve our understanding of the top quark background in the  $pp \rightarrow \text{VH}(B) \rightarrow \text{top} + \text{jet}$  process in preparation for a  $B \rightarrow \gamma\gamma$  search in the presence of Part 2. He also works on highly boosted  $B \rightarrow \gamma\gamma$  processes, probing alternative production mechanisms.

**Rebecca Meyer**  
Undergraduate Researcher, Hamilton Scholar

Spring and Summer 2018: Study of gluon splitting and bottom Higgs boson decays.

**Mateo Pato**  
University of Texas (UT) and DSN graduate student scholar

Minor scholar with the SMU group at CERN under the supervision of Francesco De Troia during the spring/summer of 2018. He was fully supported by the DSN scholarship (initially "La Chaire de physique des particules" ("Chaire" 15k, "FIS1"), aimed at young graduates to spend a three-month period in a world-renowned particle physics research center. His research there was highly boosted  $B \rightarrow \gamma\gamma$  in the context of an  $800 \mu\text{s}$  and applied Higgs candidate selection. His work is now utilized in ATLAS physics analysis and is listed in our internal notes.

**Phung Wang**  
PHD Candidate

2018 Present: Development of reweighting software for the ATLAS Four Tracker (FTK) PHC Level-2 Trigger. He also developed a study of novel jet substructure methods and their applications to jets from heavy-flavor decays, specifically  $pp \rightarrow b\bar{b} + \text{jet}$  ( $pp \rightarrow b\bar{b}b$ ).

### Past Collaborators

**Scott Cooper**  
Post-Doctoral Researcher

2018-2019: Focus on bottom quark induced jet triggers and the re-tagging of  $b \rightarrow c$  hadronic calorimeter and reduction of detector presamplers associated with Run-2 triggering. Also tag and Higgs. Racked out and detailed the model development for  $pp \rightarrow \text{VH}(B)$ . His PhD thesis documented the analysis of the first 15 fb of Run 2 data to search for  $pp \rightarrow b\bar{b} + \text{jet}$ , where  $B \rightarrow \gamma\gamma$ , and research for a semi-probabilistic particle detector in the 2018 final state. He is now a data analyst and machine learning scientist working in industry. [PHC Thesis](#)

**Jeff Ehrlich**  
PHD Candidate

2017-2017: Study of online triggering and Higgs. He is now a data analyst and machine learning scientist working in industry. [PHC Thesis](#)

**The Higgsbottom**  
Undergraduate Researcher, Hamilton Scholar

Summer 2018: A study of novel jet substructure methods and their applications to jets from heavy-flavor decays, specifically  $pp \rightarrow b\bar{b}b$ .

**Nicole Harwood**  
Undergraduate Researcher, Hamilton Scholar, Physics Major

2017-2018: Work on top quark for PhD in Physics at Hamilton University. In 2018, she developed a study of novel jet substructure methods and their applications to jets from heavy-flavor decays, specifically  $pp \rightarrow b\bar{b} + \text{jet}$ .

**Tingting Cao**  
PHD Candidate

2008-2018: Earned her PhD in 2011. Work on top quark for PhD in Physics at Hamilton University. In 2018, she developed a study of novel jet substructure methods and their applications to jets from heavy-flavor decays, specifically  $pp \rightarrow b\bar{b} + \text{jet}$ .

**Aileen Hamilton-Cook**  
Post-Doctoral Researcher

2013-2013: Work on reweighting for detector simulation for the University of Toronto. She is now a data analyst and machine learning scientist working in industry. [PHC Thesis](#)

**Matthew Wigzell**  
Undergraduate Researcher

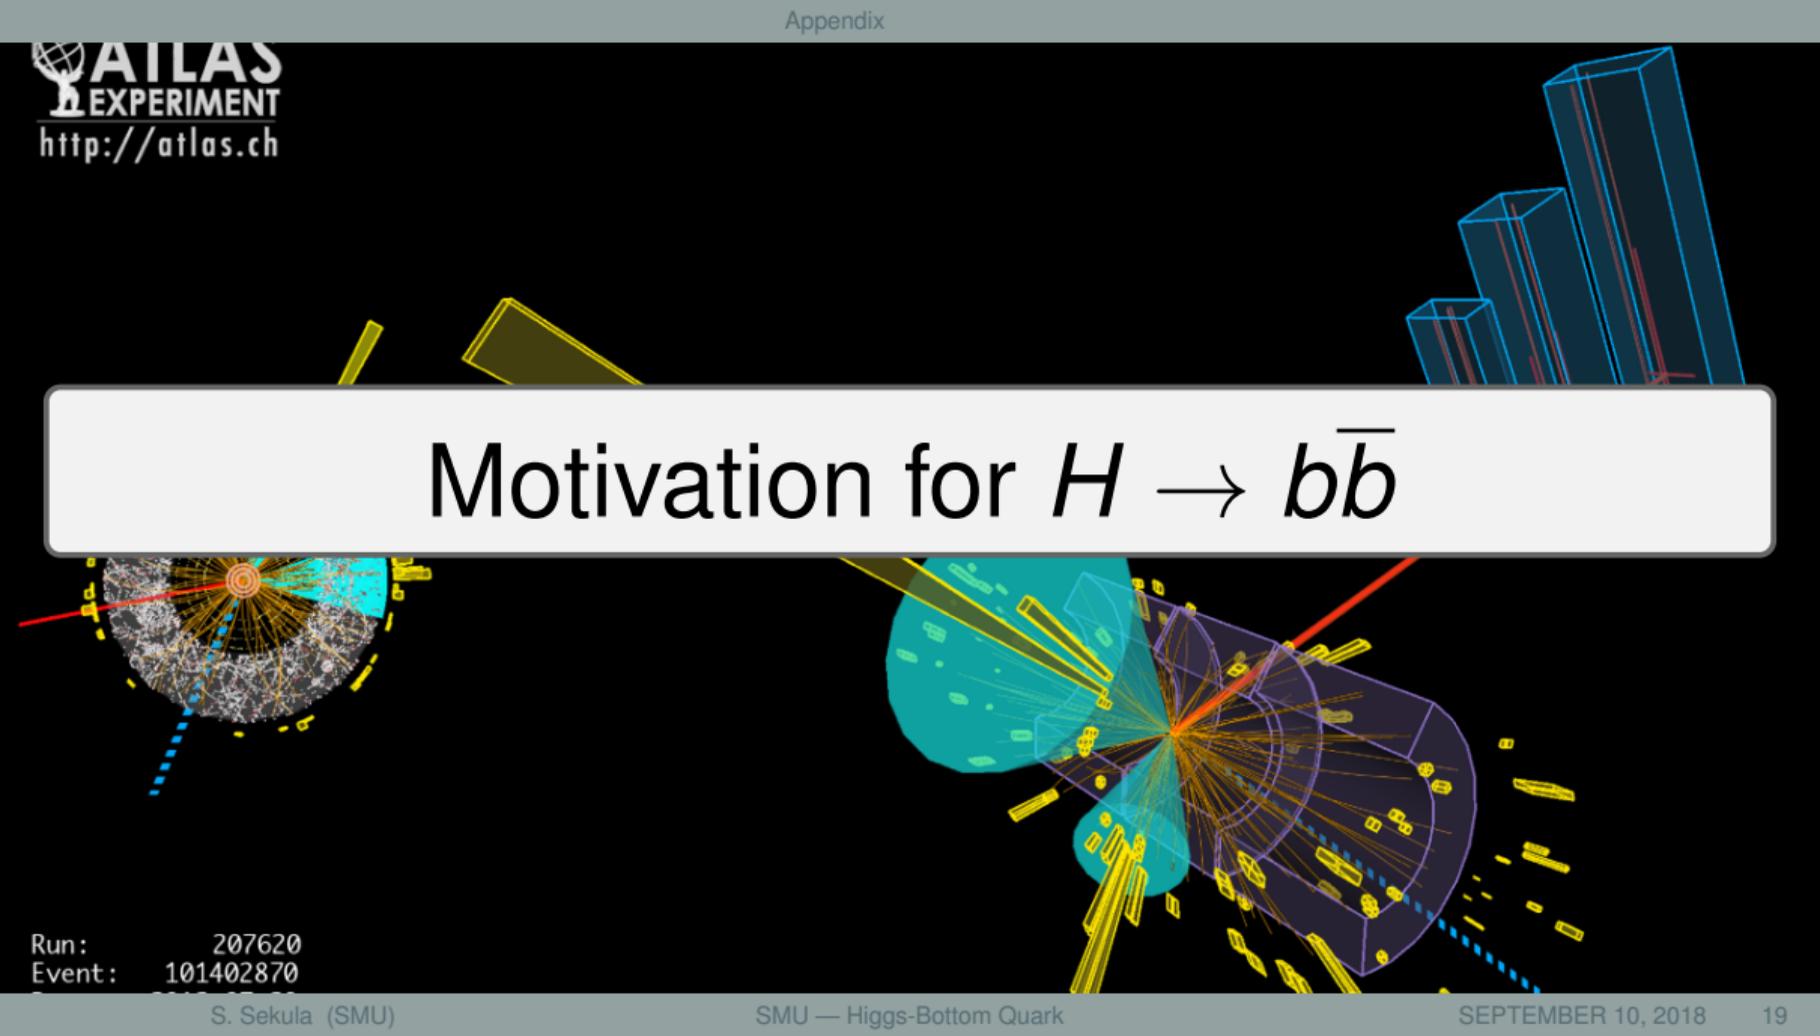

2017-2017: SMU President, Scholar and Physics Major. Passed his PhD in Physics at Harvard University starting in 2012. He researches novel methods of measuring the top quark, the multi-jet production, continuing the search for an observationally changed Higgs boson.

### Opportunities at SMU

The SMU ATLAS group is proud of all the technical and physics analysis studies that can be done at ATLAS experiment. My area often focuses on the reconstruction of the Higgs boson to heavy quarks. Events, with emphasis on the bottom quark, and include analysis notes related to that Physics in Top Triggers, Borec Tagging, and bottom binned tagging.

# APPENDIX

Motivation for  $H \rightarrow b\bar{b}$

Run: 207620  
Event: 101402870

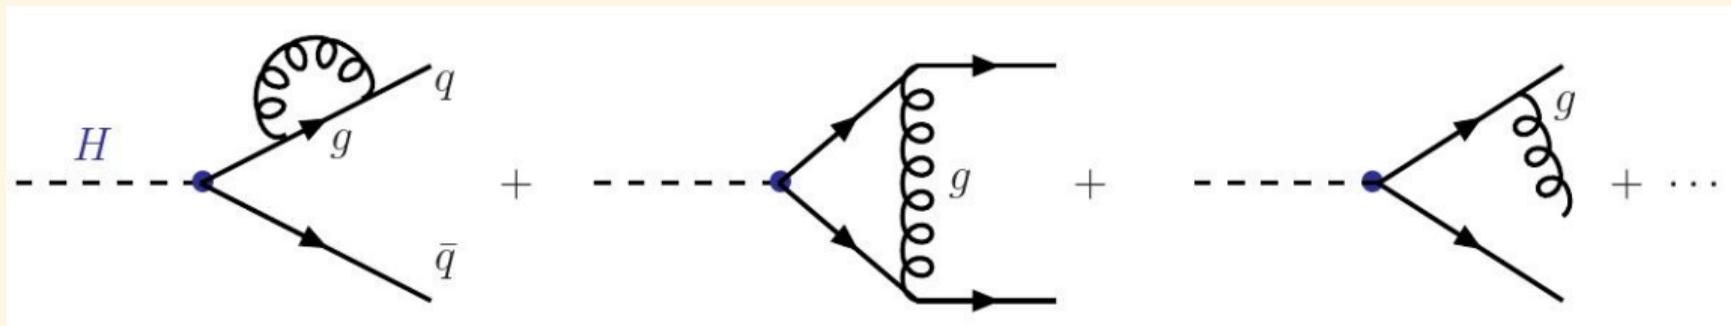

## Expected Higgs Decays — Standard Model Picture

A visual representation of the expected pattern of decay for  $m_H = 125$  GeV. The areas of final-states are relatively proportional to the expected rate of  $H \rightarrow b\bar{b}$ .

Solid lines indicate channels that have been directly observed in data as of the spring of 2017. Dashed lines indicate those channels that had not yet been observed at that time.

## $H \rightarrow b\bar{b}$ Example Feynman Diagrams

The Feynman diagrams above are from Ref. [1]. These illustrate examples of the leading-order QCD corrections to the Born-level (tree-level) diagram with a single vertex.

## $H \rightarrow b\bar{b}$ Partial Width

In the standard model, the partial width of the Higgs decay to (heavy) quarks is given at NNLO in QCD by [1]:

$$\Gamma(H \rightarrow q\bar{q}) = \frac{3G_\mu}{4\sqrt{2}\pi} M_H \bar{m}_q^2(M_H) \left[ 1 + \Delta_{qq} + \Delta_H^2 \right] \quad (2)$$

where

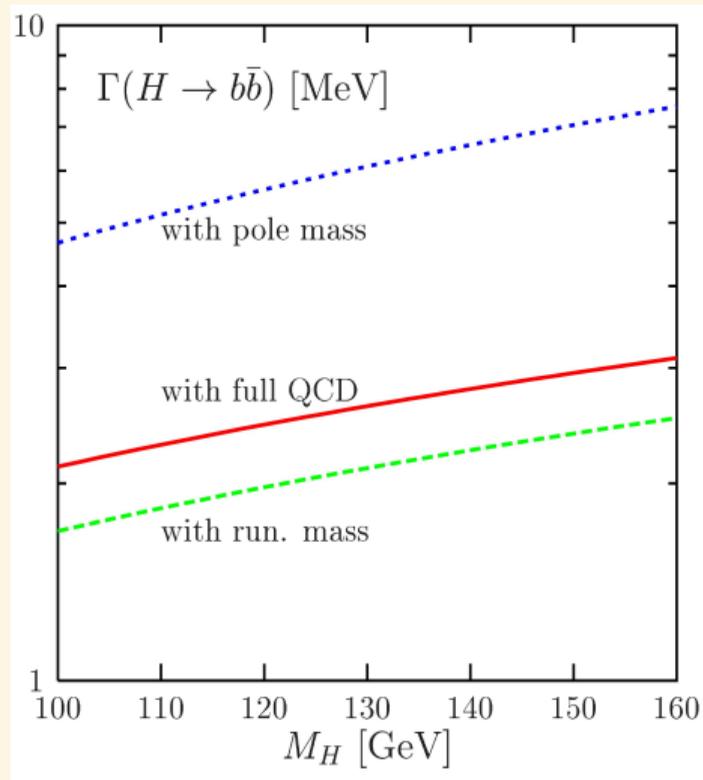

$$\begin{aligned} \Delta_{qq} = & 5.67 \frac{\bar{\alpha}_s}{\pi} + (35.94 - 1.36N_f) \frac{\bar{\alpha}_s^2}{\pi^2} \\ & + (164.14 - 25.77N_f + 0.26N_f^2) \frac{\bar{\alpha}_s^3}{\pi^3} \end{aligned} \quad (3)$$

and

$$\Delta_H^2 = \frac{\bar{\alpha}_s^2}{\pi^2} \left( 1.57 - \frac{2}{3} \log \frac{M_H^2}{m_t^2} + \frac{1}{9} \log^2 \frac{\bar{m}_q^2}{M_H^2} \right) \quad (4)$$

## Comments on the partial width in the standard model

- ▶ The partial width depends on well-established fundamental constants, the running quark mass, and the mass of the Higgs boson
- ▶ The established Higgs mass is 125.09 GeV based on the Run 1 ATLAS+CMS combination
- ▶ At the measured value of the mass, the full width is 4.100 MeV (with an uncertainty of about 2%)
- ▶ Focus on the “Full QCD curve” - at measured  $m_H$ ,  $\Gamma_{bb} \approx 2.5$  MeV yielding  $\mathcal{B}_{bb} \approx 60\%$

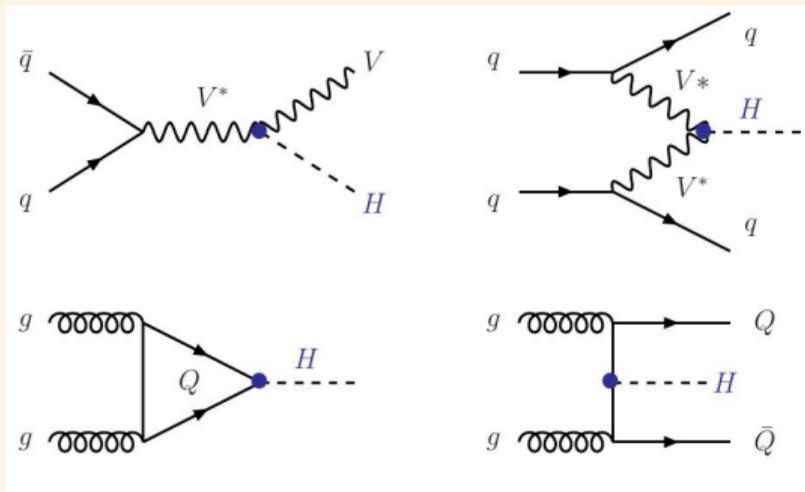

## State-of-the-art branching ratio calculation

The state-of-the-art branching fraction calculations for  $H \rightarrow b\bar{b}$  include next-to-leading order (NLO) electroweak corrections, as well as massless QCD corrections up to NNNLO (c.f. Ref. [5, 6]). The current prediction in the SM for  $m_H = 125.09$  GeV is:

$$\mathcal{B}(H \rightarrow b\bar{b}) = 0.5809 \pm 0.65\%(\text{THU})_{-0.74\%}^{+0.72\%}(\text{PU})(m_q)_{-0.79\%}^{+0.77\%}(\text{PU})(\alpha_s) \quad (5)$$

where “THU” refers to theory uncertainties due to missing higher-order corrections, “PU( $m_q$ )” to parametric uncertainties from the quark masses, and “PU( $\alpha_s$ )” to parametric uncertainties from the strong coupling constant.

## Production Mechanisms

Mode	Cross-section (pb)
ggF	48.52
VBF	3.779
WH	1.369
ZH	0.8824
ttH	0.5065
bbH	0.4863

$(\sqrt{s} = 13 \text{ TeV [5]})$

The above are the leading-order diagrams [1] for the leading Higgs production mechanisms at the LHC. Clock-wise from upper-left, these are: vector boson associated (VBA) production, vector boson fusion (VBF),  $(t\bar{t}/b\bar{b})H$  production, and gluon fusion (ggF).
